The No Core Shell Model for Bound, Resonant and Scattering States

### Bruce R. Barrett University of Arizona, Tucson

Arizona's First University.

**TRIUMF** Workshop

February 21-23, 2013

### **COLLABORATORS**

Christian Forssen, Chalmers U. of Tech., Goteborg, Sweden Nicolas Michel, NSCL, Michigan State University George Papadimitriou, University of Arizona Marek Ploszajczak, GANIL, Caen, France Jimmy Rotureau, Chalmers U. of Tech., Goteborg, Sweden

### OUTLINE

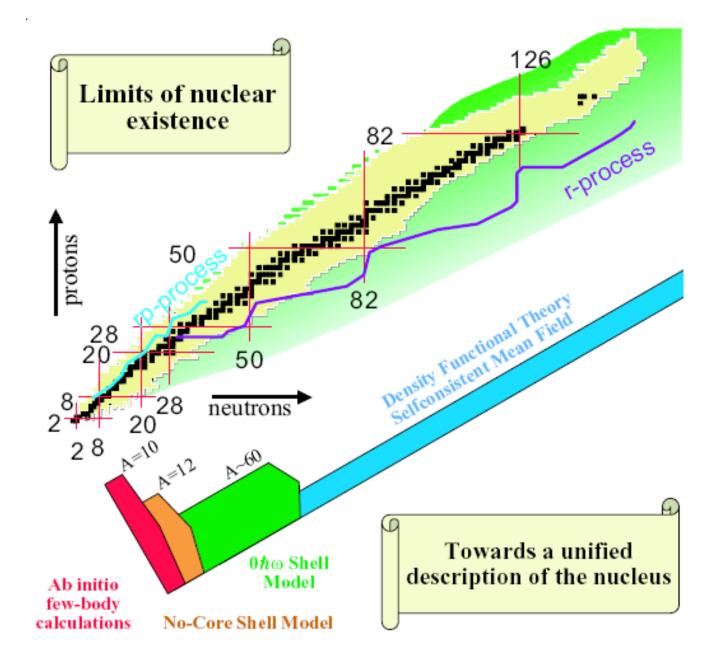

I. Introduction: No Core Gamow Shell Model (NCGSM)

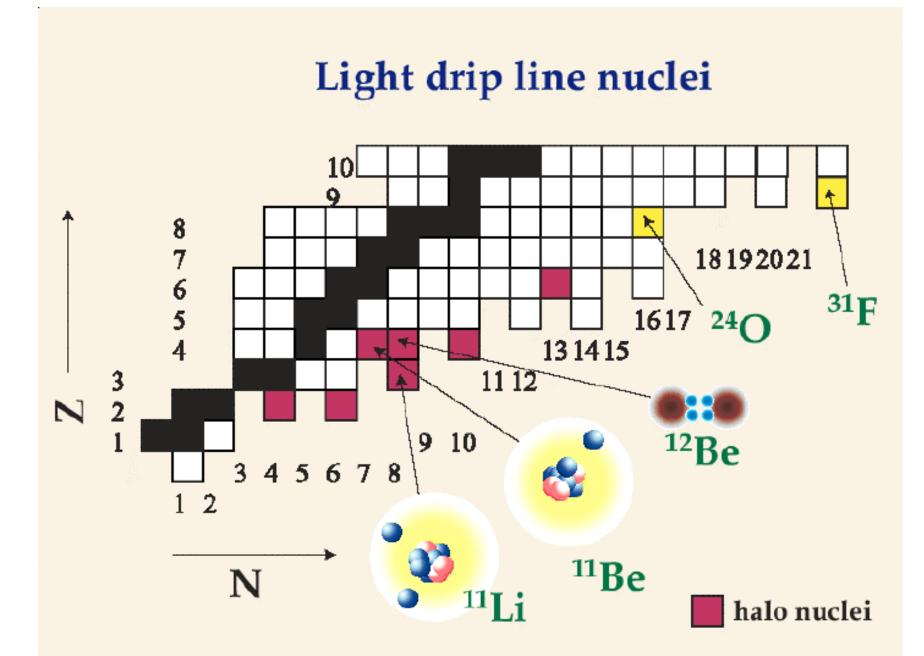

II. NCGSM Formalism

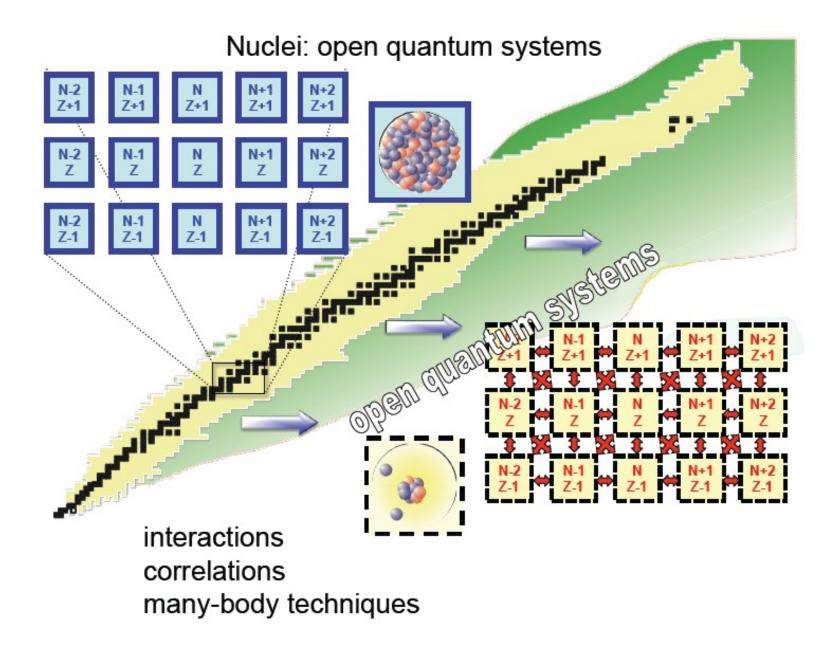

III. NCGSM: Applications to Light Nuclei

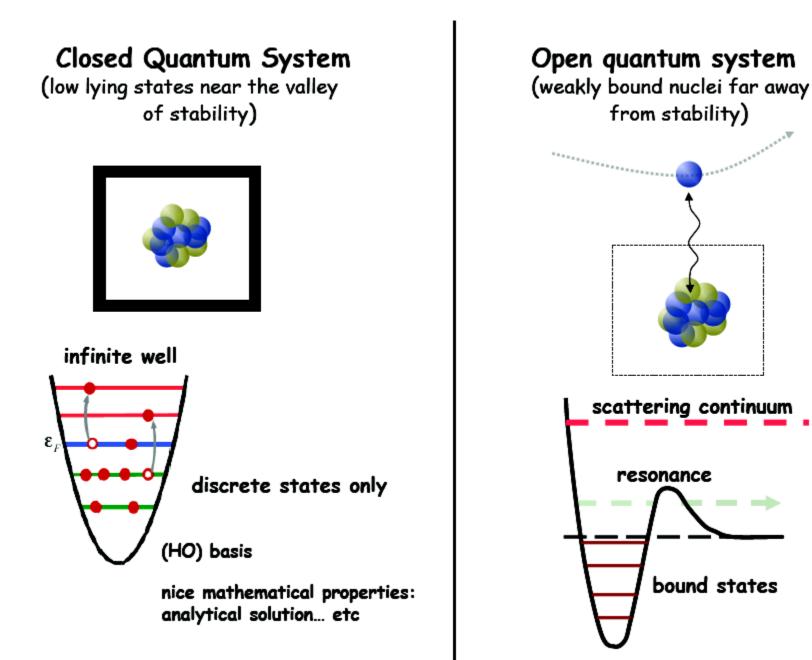

IV. Summary and Outlook

I. Introduction: No Core Gamow Shell Model

## II. NCGSM Formalism

#### Resonant and non-resonant states (how do they appear?)

 $u_l(k,r) \sim C_*H_l^+(k,r), r \rightarrow \infty$  bound states, resonances  $u_l(k,r) \sim C_*H_l^+(k,r) + C_H_l^-(k,r), r \rightarrow \infty$  scattering states

#### The Berggren basis (cont'd)

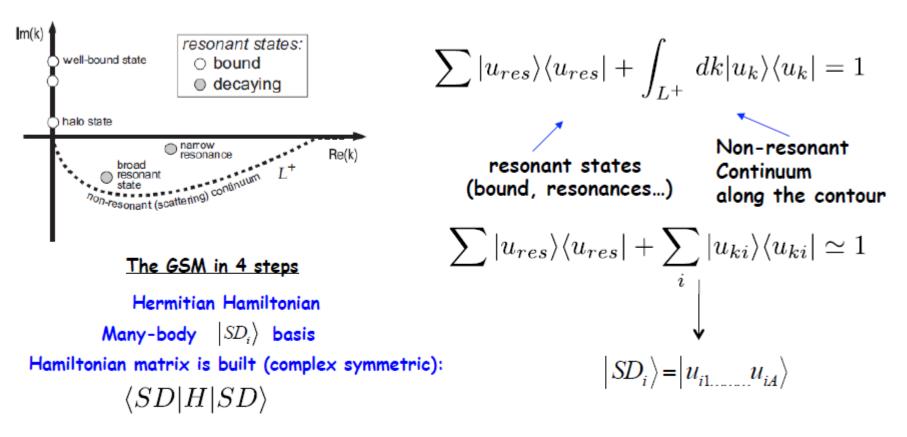

The shape of the contour is arbitrary, but it has to be below the resonance(s) position(s) (proof by T. Berggren)

In practice the continuum is discretized via a quadrature rule (e.g Gauss-Legendre):

$$\sum |u_{res}\rangle \langle u_{res}| + \sum_{i} |u_{ki}\rangle \langle u_{ki}| \simeq 1 \qquad \text{with} \qquad |u_k\rangle = \sqrt{\omega_i} |u_{ki}\rangle$$

#### Berggren's Completeness relation and Gamow Shell Model N.Michel et.al 2002 PRL 89 042502

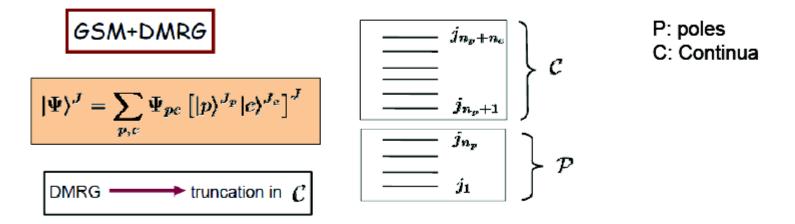

Hamiltonian diagonalized

$$|\Psi
angle = \sum_{n} c_n |SD_n
angle$$

Many body correlations and coupling to continuum are taken into account simultaneously

Truncation Method applied to lattice models, spin chains, atomic nuclei....

✓ Iterative method: In each step ( $N_{step}$ ) a scattering shell is added from C. → Hamiltonian is diagonalized and density matrix is constructed:

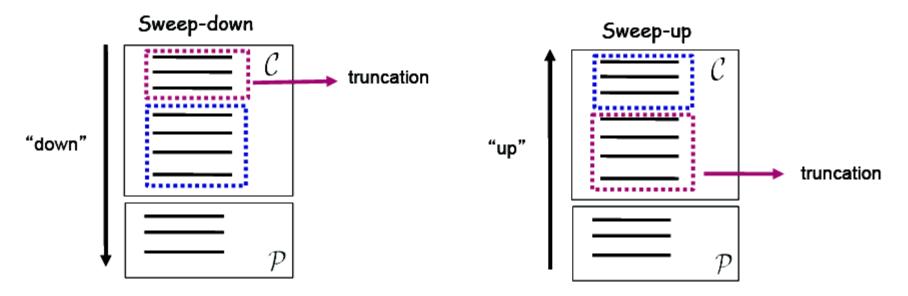

$$\rho^{J_c}_{c,c'} = \sum_p \Psi_{pc} \Psi_{pc'}$$

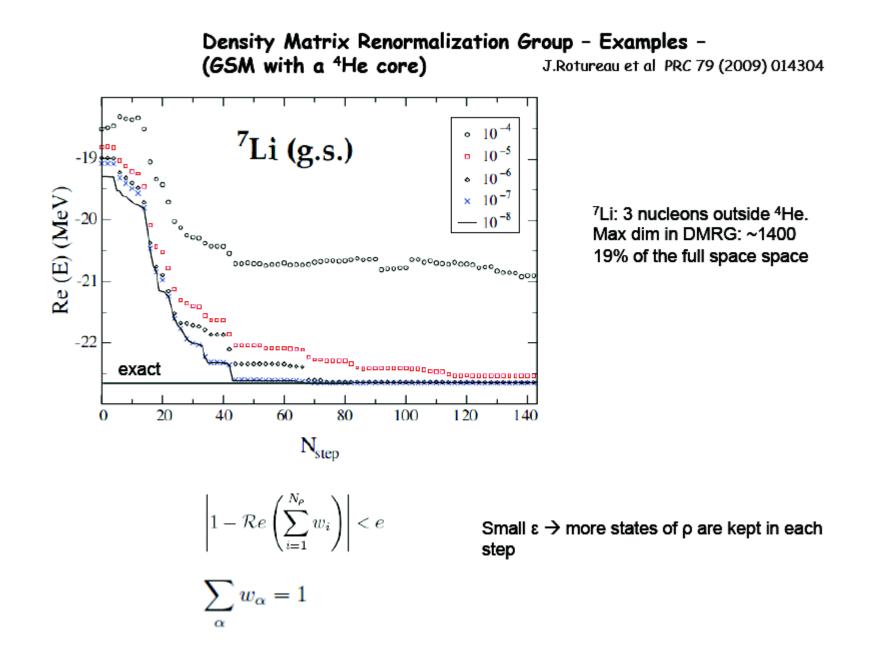

truncation with the density matrix :

$$ho_{c,c'}^{J_c} = \sum_p \Psi_{pc} \Psi_{pc'}$$

N<sub>opt</sub> states that correspond to the largest eigenvalues of the density matrix are kept

- The process is reversed...
- In each step (shell added) the Hamiltonian is diagonalized and N<sub>opt</sub> states are kept.
- Iterative method to take into account all the degrees of freedom in an effective manner.
- In the end of the process the result is the same with the one obtained by "brute" force diagonalization of H.

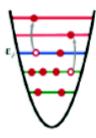

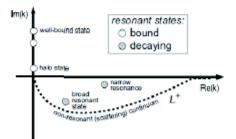

Gamow Shell Model in an ab-initio framework

$$H = \frac{1}{A} \sum_{i < j}^{A} \frac{(\vec{p}_i - \vec{p}_j)^2}{2m} + V_{NN,ij} + \dots \quad (1)$$

- Only NN forces at present
  - → Argonne V18, (Wiringa, Stoks, Schiavilla PRC 51, 38, 1995)
  - $\rightarrow$  N<sup>3</sup>LO (D.R.Entem and R. Machleidt PRC(R) 68, 041001, 2003)
  - → V<sub>lowk</sub> technique used to decouple high/low momentum nodes. Λ<sub>Vlowk</sub> = 1.9 fm<sup>-1</sup> (5. Bogner et al, Phys. Rep. 386, 1, 2003)
- Basis states
   → s- and p- states generated by the HF potential

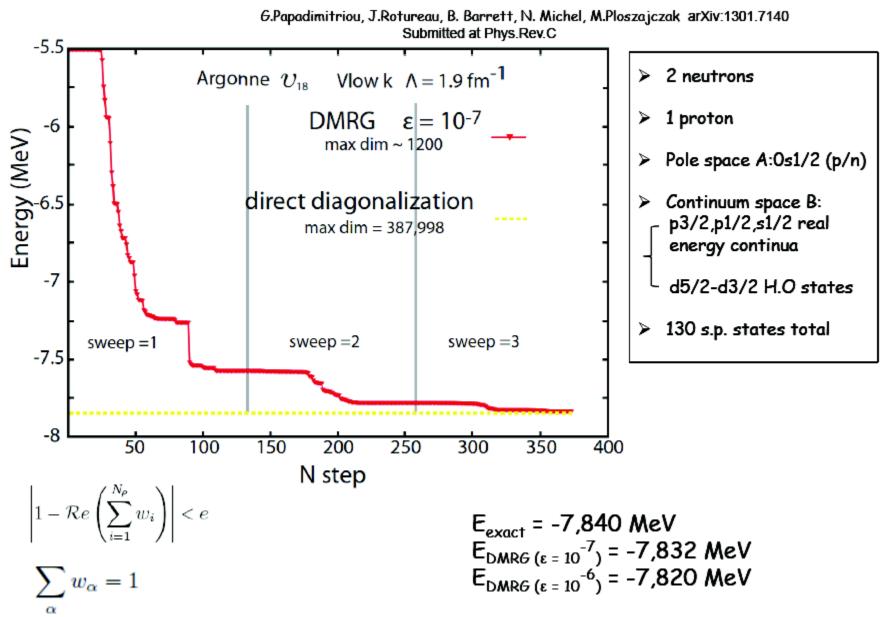

Diagonalization of (1) → Applications to <sup>3</sup>H, <sup>4</sup>He, <sup>5</sup>He

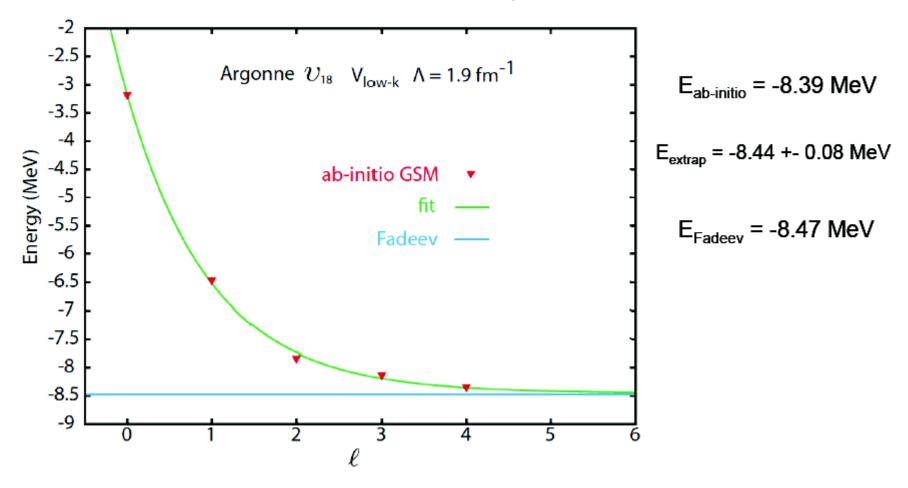

### III. NCGSM: Applications to Light Nuclei

#### Results

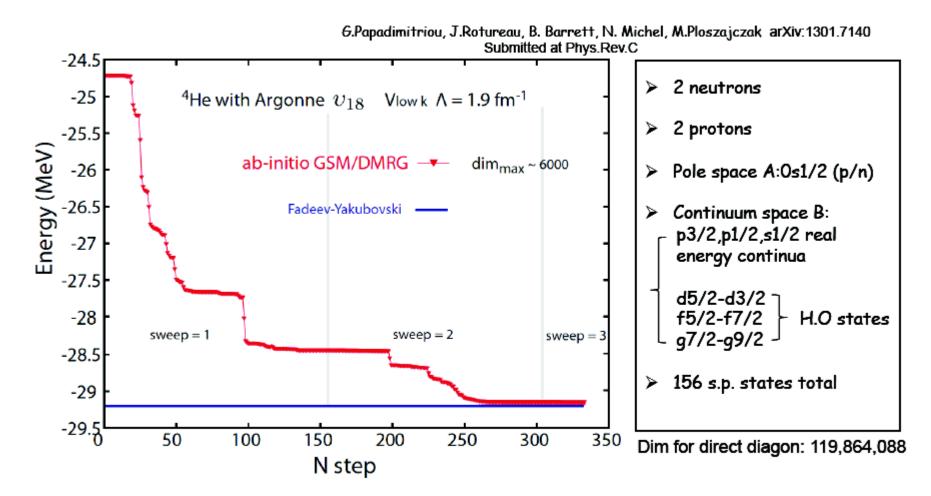

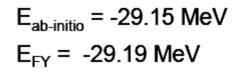

#### **Results:** Triton

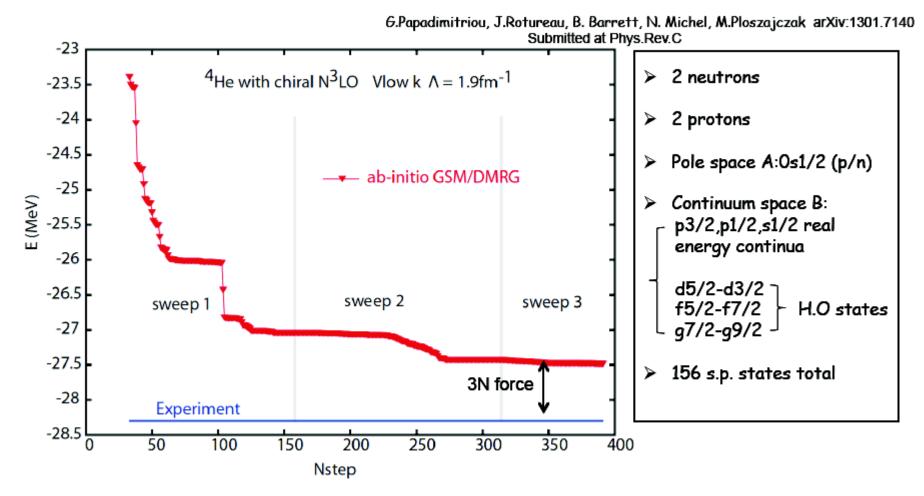

6.Papadimitriou, J.Rotureau, B. Barrett, N. Michel, M.Ploszajczak arXiv:1301.7140 Submitted at Phys.Rev.C

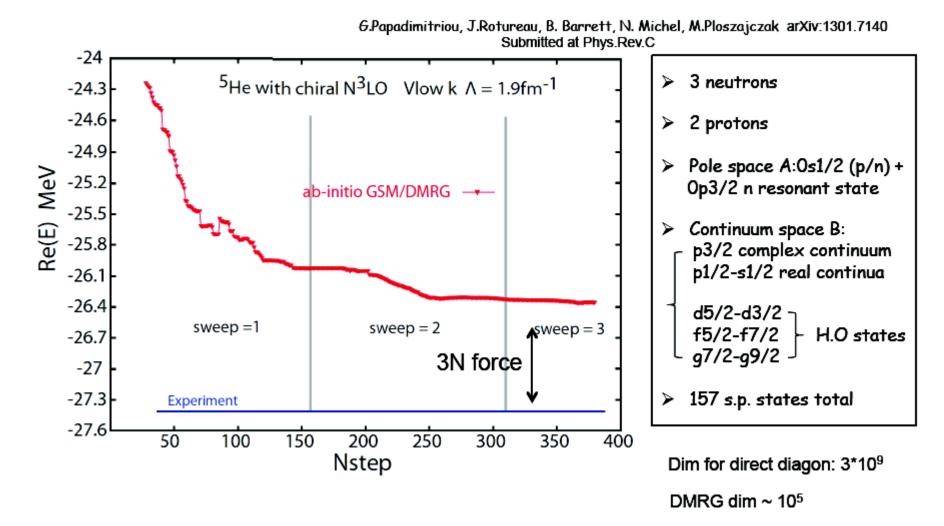

Fadeev result from (Nogga, Bogner, Schwenk, PRC 70,061002, 2004)

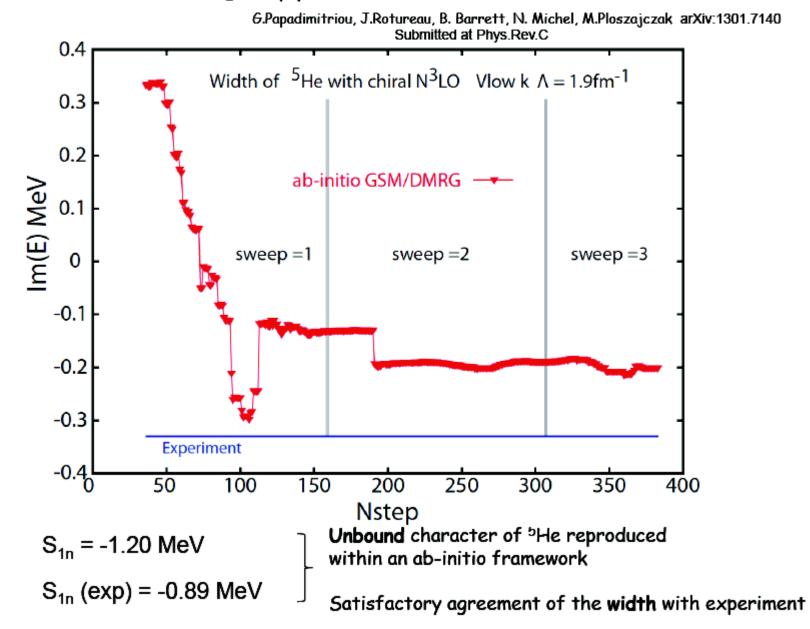

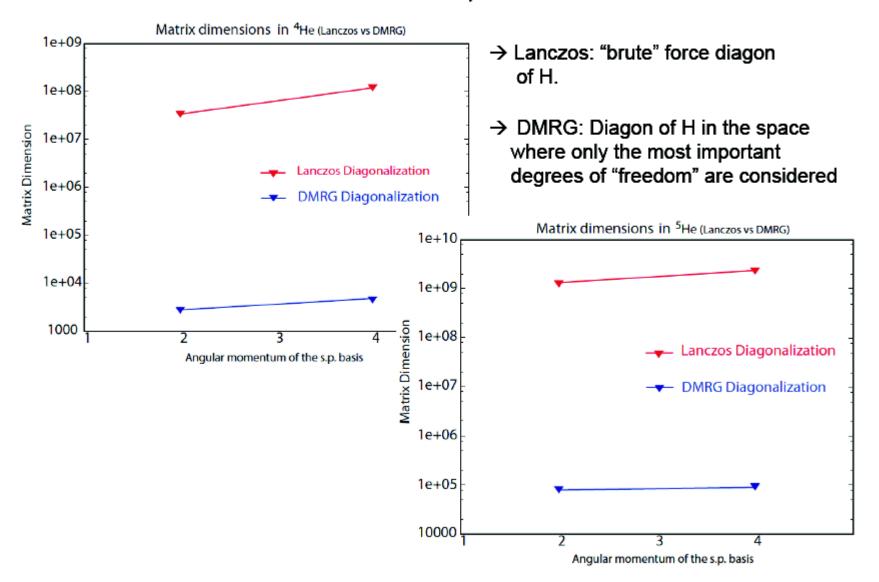

3N force arises from the renormalization of the NN interaction.

Results: <sup>5</sup>He imaginary part (width) with chiral N<sup>3</sup>LO

#### Dimension comparison

### IV. Summary and Outlook

# IV. Summary and Outlook

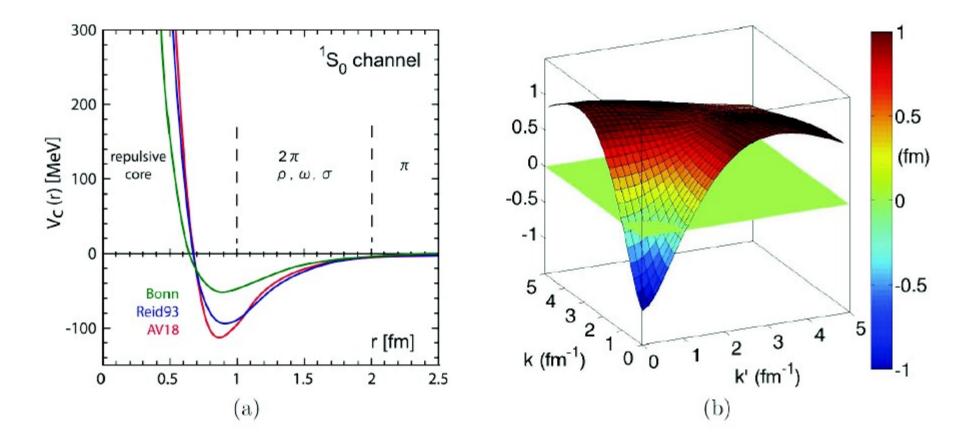

1. The Berggren basis is appropriate for calculations of weakly bound/unbound nuclei.

2. Berggren basis has been applied successfully in an ab-initio GSM framework --> No Core Gamow Shell Model for weakly bound/unbound nuclei.

3. Diagonalization with DMRG makes calculations feasible for heavier nuclei using Gamow states.

4. Future applications to heavier nuclei and to nuclei near the driplines.

### Realistic two-body potentials in coordinate and momentum space

#### Repulsive core makes calculations difficult

- → Need to decouple high/low momentum modes
- ✓ Achieved by V<sub>low-k</sub> or Similarity RG approaches (e.g. SRG)

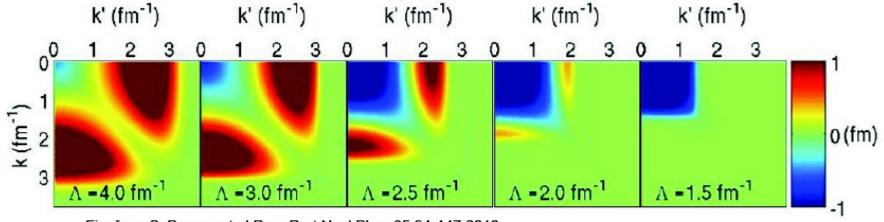

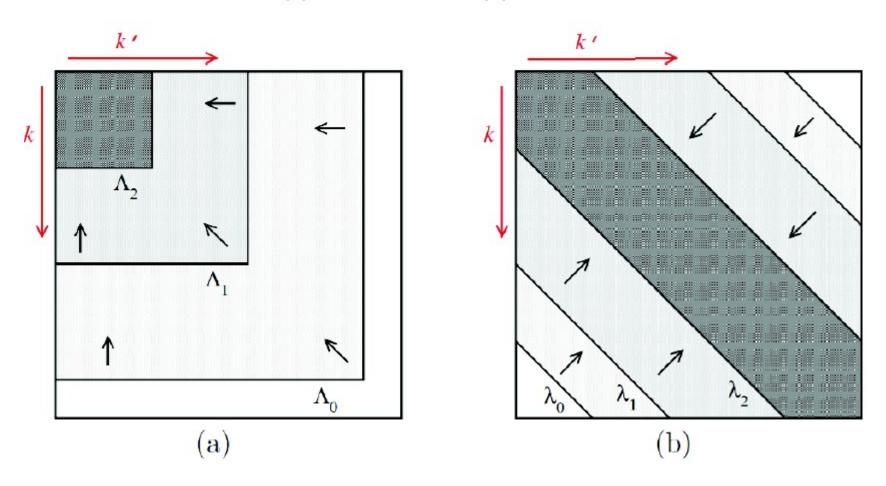

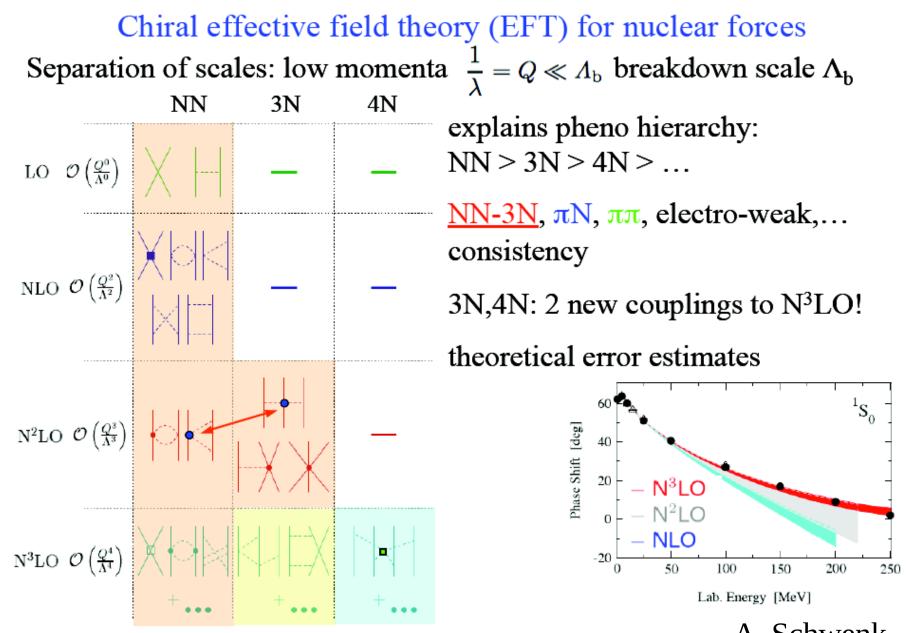

Fig. from S. Bogner et al Prog.Part.Nucl.Phys.65:94-147,2010

- → Observable physics is preserved (e.g. NN phase shifts) AND calculations become easier (work with the relevant degrees of freedom)
- → One has to deal with "induced" many-body forces...

Illustration on how the high momentum nodes are integrated out in the Vlowk (a) and in the SRG (b) RG methods

Weinberg, van Kolck, Kaplan, Savage, Wise, Epelbaum, Meissner, Nogga, Machleidt,...A. Schwenk
