Many-Body Solution via  
NCSM, CC, IM-SRG,...

Similarity Renormalization  
Group

NN+3N Interactions from  
Chiral EFT

## Low-Energy QCD

- initial formulation typically limited to bound-state basis
- description of continuum effects and observables not possible
- improvement: include continuum degrees of freedom explicitly
- here: **NCSM with Continuum**

# Ab Initio Workflow

## Nuclear Structure & Reaction Observables

Similarity Renormalization  
Group

NN+3N Interactions from  
Chiral EFT

## Low-Energy QCD

- drastically improves convergence but induces many-body forces
- induced beyond-3N interactions are a major limitation for many applications
- improvement: either include or suppress induced forces
- here: **Block Generators**

NN+3N Interactions from  
Chiral EFT

## Low-Energy QCD

- chiral EFT offers systematics, improvability and uncertainty estimation
- typically one "chiral interaction" is used in nuclear structure
- improved chiral EFT interactions offer opportunity to quantify uncertainties systematically
- here: **initial NCSM studies with NN from LO to N4LO**

# NCSM with Continuum for the Structure of ${}^9\text{Be}$

with

J. Langhammer, P. Navrátil,  
S. Quaglioni, G. Hupin, A. Calci

Phys. Rev. C 91, 021301(R) (2015)

# NCSM with Continuum

Baroni, Navrátil, Quaglioni, *Phys. Rev. Lett.* 110, 022505 (2013)

**comprehensive ab initio description of light nuclei**

bound states  
& spectroscopy

resonances  
& scattering states

**(IT-)NCSM**

ab initio description of  
nuclear clusters

**NCSMC**

**RGM**

describing relative  
motion of clusters

focus on NCSMC with 3N interactions  
for p-shell spectroscopy

# NCSMC with 3N Forces

Hupin, Langhammer, Navrátil, Quaglioni, Calci, Roth; Phys. Rev. C 88, 054622 (2013)

- representing  $H|\psi^{J\pi T}\rangle = E|\psi^{J\pi T}\rangle$  using the **over-complete basis**

$$|\Psi^{J\pi T}\rangle = \sum_{\lambda} c_{\lambda} |\Psi_A E_{\lambda} J^{\pi} T\rangle + \sum_{\nu} \int dr r^2 \frac{\chi_{\nu}(r)}{r} |\xi_{\nu r}^{J\pi T}\rangle$$

expansion in  $A$ -body  
(IT-)NCSM eigenstates

identical to the  
NCSM/RGM expansion

leads to the **NCSMC equations**

$$\begin{pmatrix} H_{\text{NCSM}} & h \\ h & \mathcal{H} \end{pmatrix} \begin{pmatrix} c \\ \chi(r)/r \end{pmatrix} = E \begin{pmatrix} c \\ \chi(r)/r \end{pmatrix}$$

access targets beyond  
 ${}^4\text{He}$  using uncoupled densities  
and on-the-fly algorithm

with  $3N$  contributions in

$H_{\text{NCSM}}$

covered by  
(IT-)NCSM

$h$

given by  
 $\langle \Psi_A E_{\lambda'} J^{\pi} T | \hat{H} | \xi_{\nu r}^{J\pi T} \rangle$

$\mathcal{H}$

contains NCSM/RGM  
Hamiltonian kernel

# Ab Initio Description of ${}^9\text{Be}$

Langhammer, Navrátil, Quaglioni, Hupin, Calci, Roth; *Phys. Rev. C* 91, 021301(R) (2015)

- ${}^9\text{Be}$  is excellent candidate to study continuum effects on spectra
- all excited states are resonances
- previous NCSM studies with NN interactions show clear discrepancies in spectrum: 3N or continuum effects?
- include  $n$ - ${}^8\text{Be}$  continuum in NCSMC
- use standard NN+3N Hamiltonian:
  - NN: N3LO, Entem & Machleidt, 500 MeV cutoff
  - 3N: N2LO, Local, 500 MeV cutoff

# ${}^9\text{Be}$ : Convergence of Phase Shifts

Langhammer, Navrátil, Quaglioni, Hupin, Calci, Roth; *Phys. Rev. C* 91, 021301(R) (2015)

$$\alpha = 0.0625 \text{ fm}^4, \quad \hbar\Omega = 20 \text{ MeV}, \quad E_{3\text{max}} = 14$$

- include  $0^+$ ,  $2^+$  states of  ${}^8\text{Be}$
- include 6 negative and 4 positive parity states of  ${}^9\text{Be}$
- negative parity phase-shifts are well converged, positive parity more difficult
- extract resonance parameters from inflection point and derivative

# ${}^9\text{Be}$ : NCSM vs. NCSMC

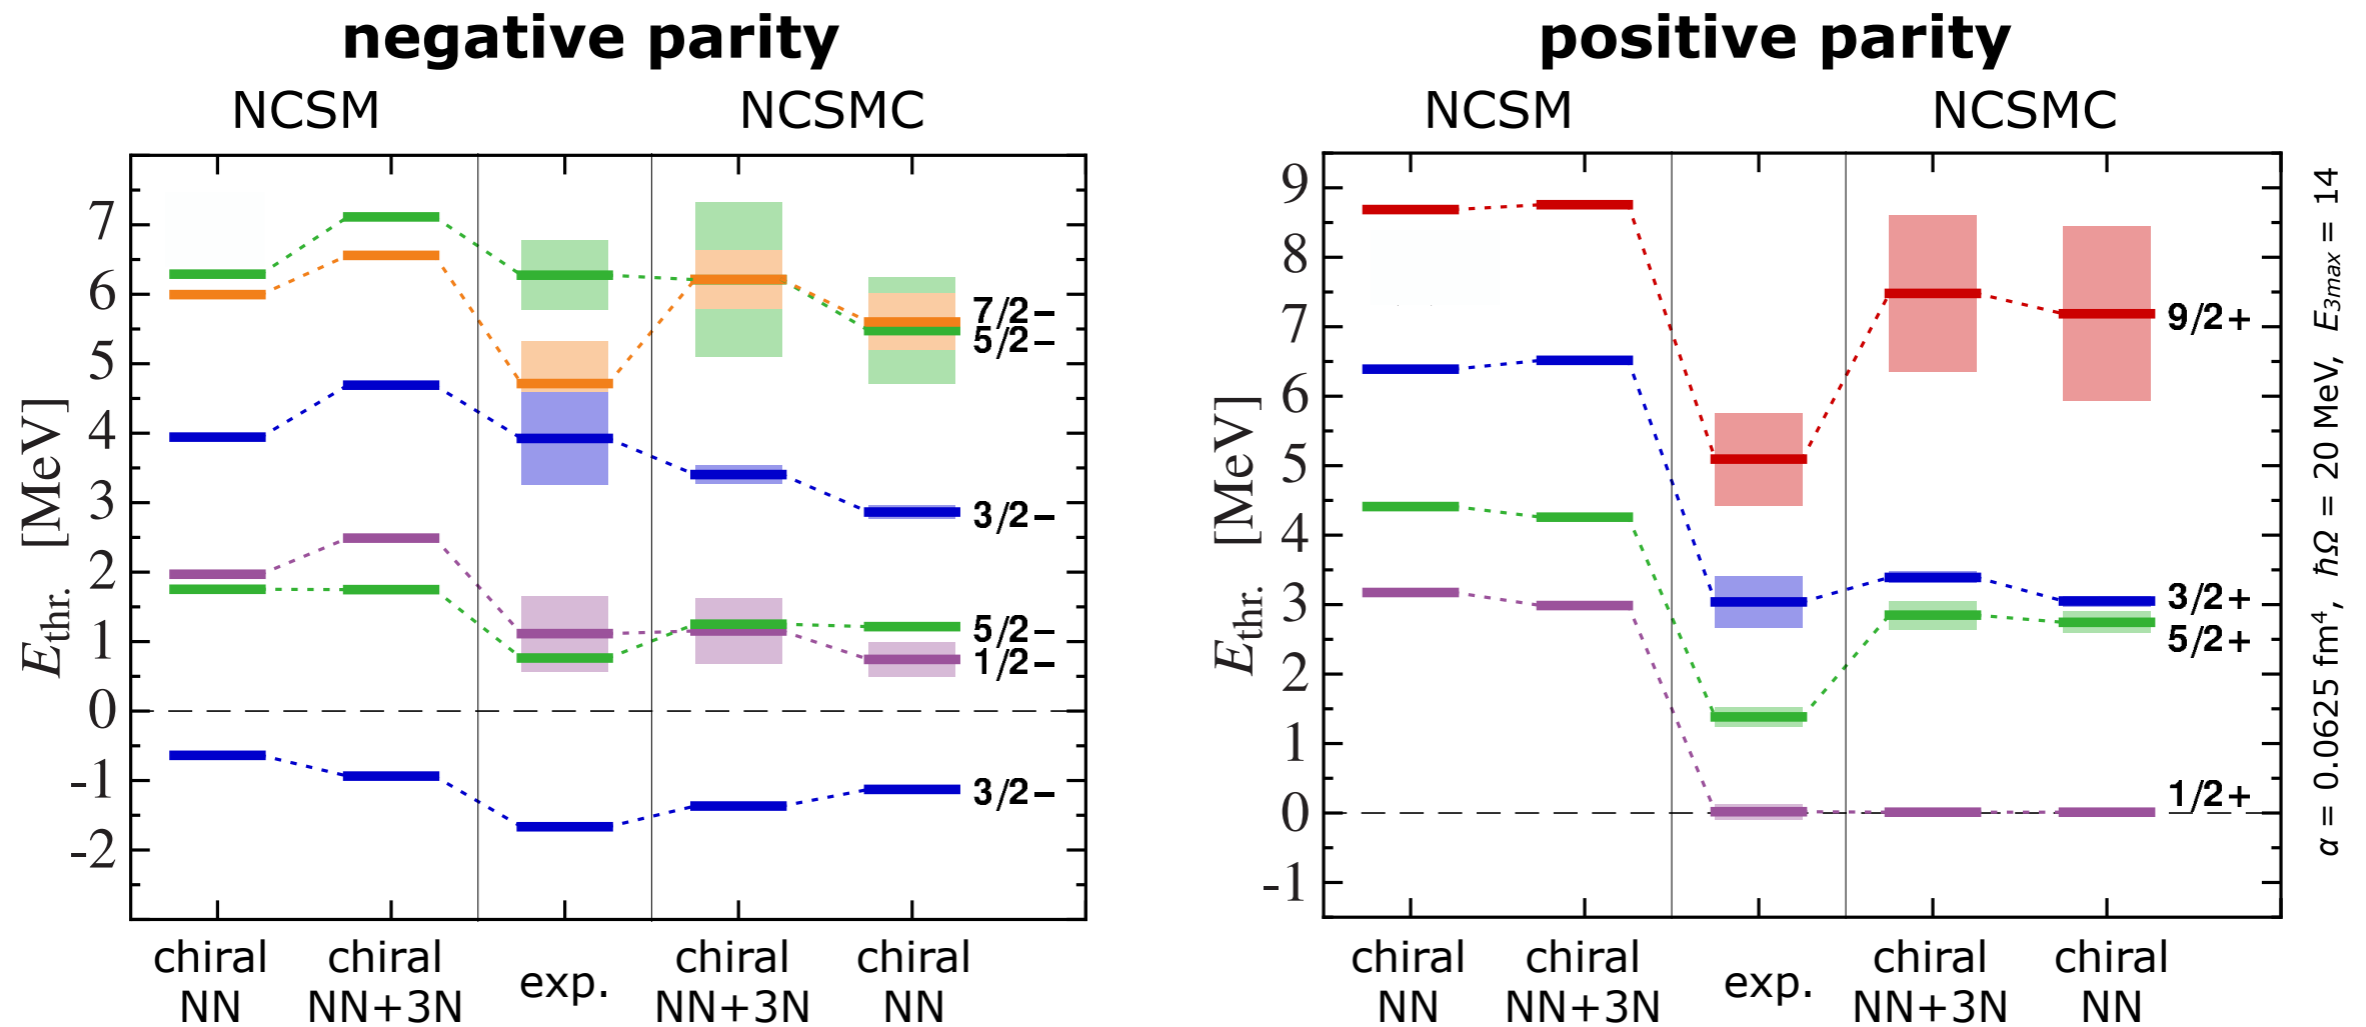

Langhammer, Navrátil, Quaglioni, Hupin, Calci, Roth; *Phys. Rev. C* 91, 021301(R) (2015)

- NCSMC shows much better  $N_{\text{max}}$  convergence
- NCSM tries to capture continuum effects via large  $N_{\text{max}}$
- drastic difference for the  $1/2^+$  state right at threshold

# ${}^9\text{Be}$ : Spectrum

Langhammer, Navrátil, Quaglioni, Hupin, Calci, Roth; *Phys. Rev. C* 91, 021301(R) (2015)

- continuum plays more important role than chiral 3N interaction
- NCSMC predictions for widths are in fair agreement with experiment

# SRG with Block Generators

with

A. Calci, N. M. Dicaire, C. Omand, P. Navrátil,  
T. Hüther, S. Schulz, K. Vobig

# Similarity Renormalization Group

Glazek, Wilson, Wegner, Perry, Bogner, Furnstahl, Hergert, Roth, Navrátil...

continuous unitary transformation to  
**pre-diagonalize Hamiltonian** and thus improve  
model-space convergence

- **consistent unitary transformation** of Hamiltonian and observables

$$H_\alpha = U_\alpha^\dagger H U_\alpha$$

$$O_\alpha = U_\alpha^\dagger O U_\alpha$$

- evolution equations for  $H_\alpha$  and  $U_\alpha$

$$\frac{d}{d\alpha} H_\alpha = [\eta_\alpha, H_\alpha]$$

$$\frac{d}{d\alpha} U_\alpha = G_\alpha U_\alpha$$

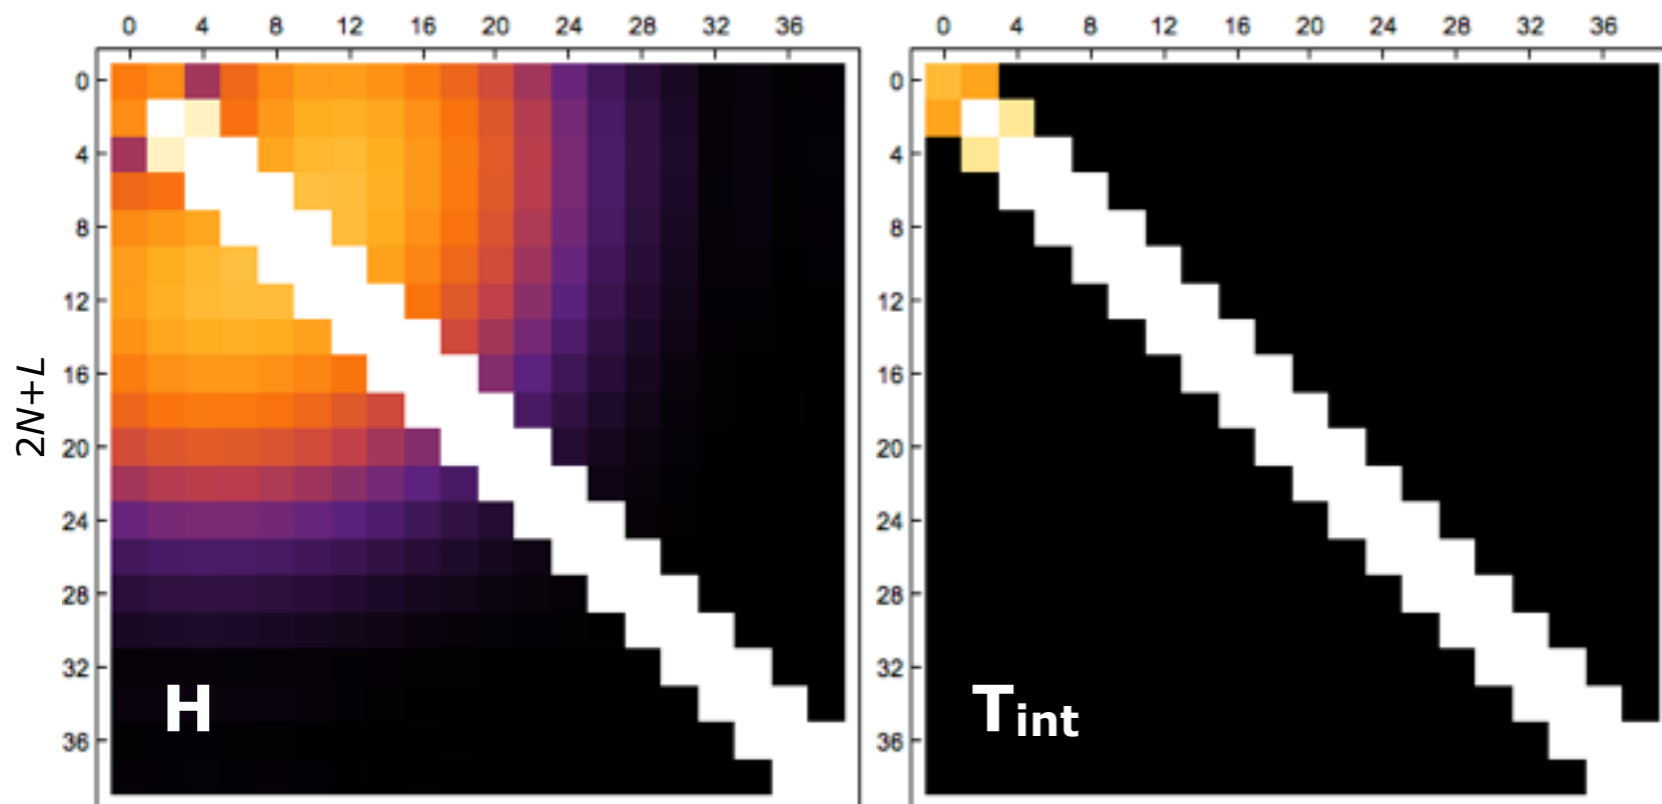

design  $G_\alpha$  for optimum  
compromise between convergence &  
induced many-body forces

- **dynamic generator**  $\eta_\alpha$  drives towards “diagonal” defined by  $G_\alpha$

$$\eta_\alpha = (2\mu)^2 [G_\alpha, H_\alpha]$$

# Choice of Generator: $T_{\text{int}}$

- standard choice for  $G_\alpha$  is **intrinsic kinetic energy  $T_{\text{int}}$**
- drives diagonalization everywhere, also for low-lying basis states that are covered explicitly by many-body model space
- rule of thumb: the **more diagonal** the **more induced many-body interactions**

HO matrix elements,  $^1S_0$  channel,  $\hbar\Omega = 24$  MeV

# Choice of Generator: Block Generators

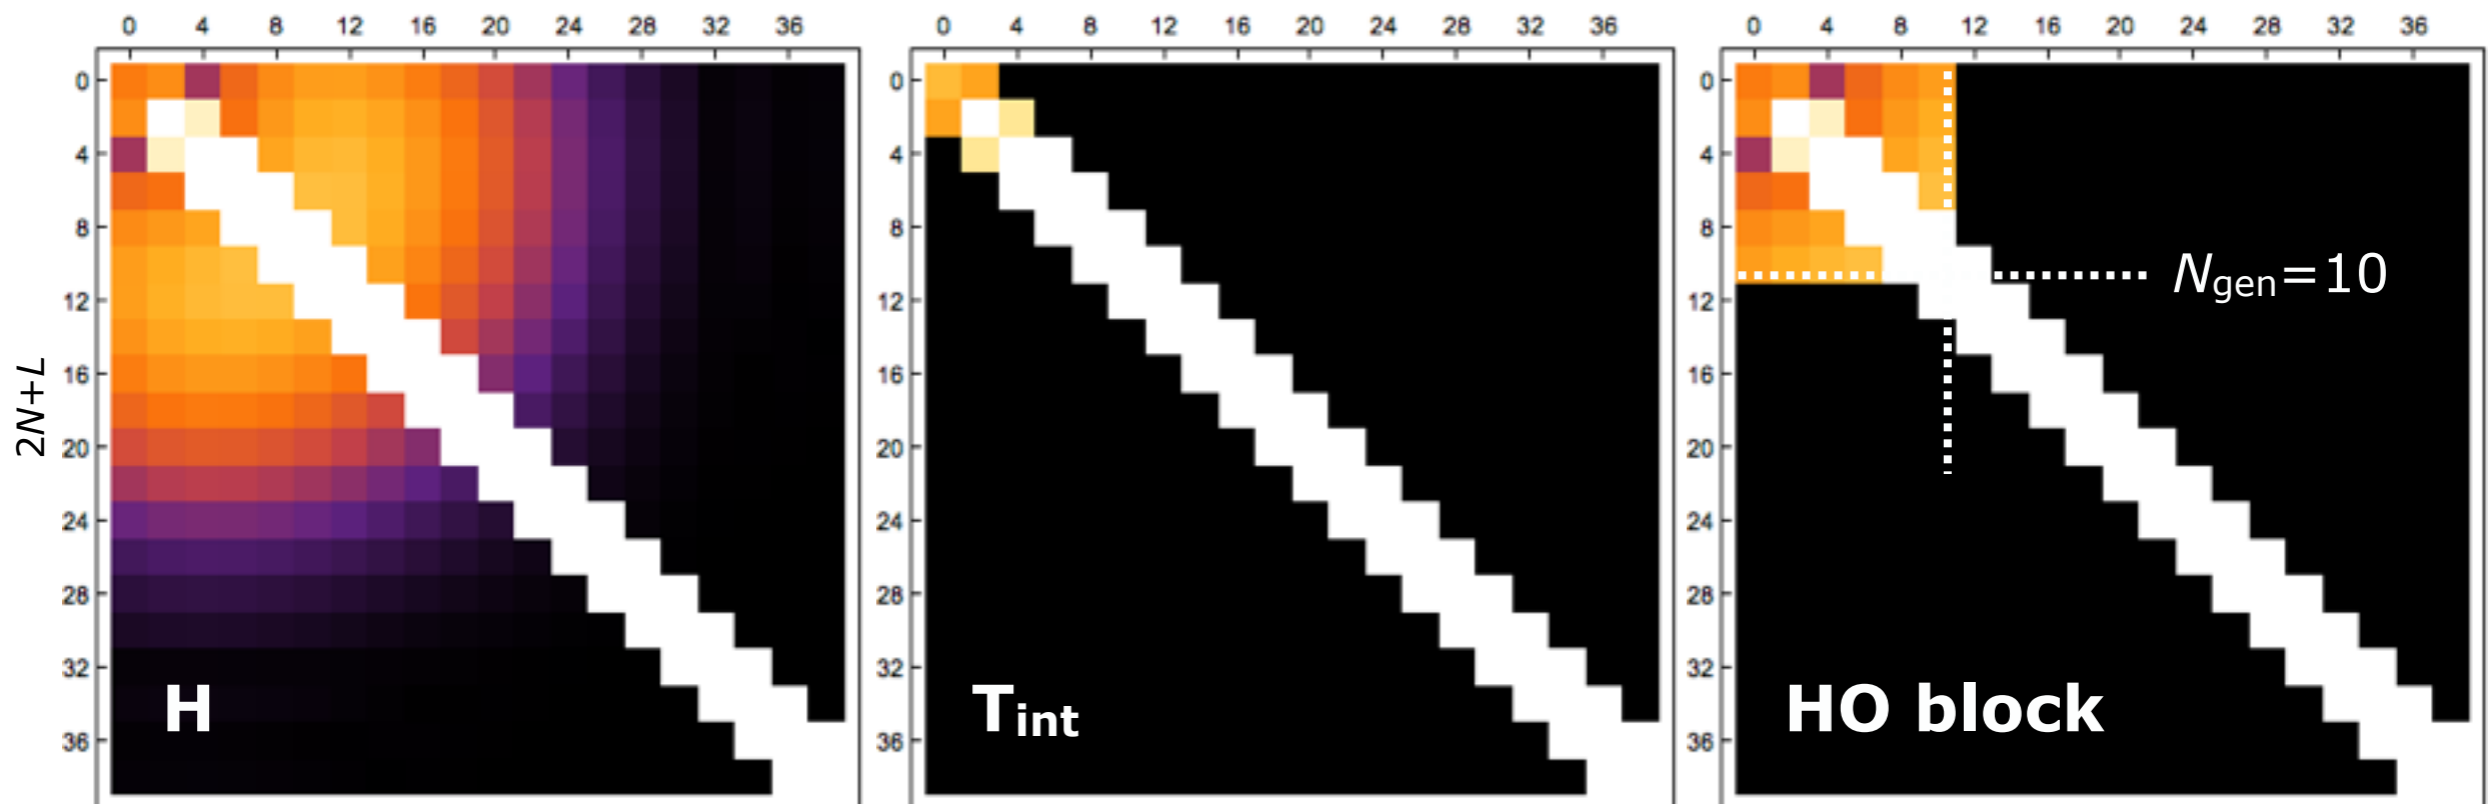

*Dicaire, Omand, Navrátil; Phys. Rev. C 90, 034302 (2014)*

- **HO block generator**: use  $H_\alpha$  matrix elements for states below  $N_{\text{gen}}$  and  $T_{\text{int}}$  matrix elements above, i.e.,

$$G_\alpha = T_{\text{int}} + \Pi_{N_{\text{gen}}} V_\alpha \Pi_{N_{\text{gen}}}$$

with projection operator  $\Pi_{N_{\text{gen}}}$  on rel. HO states with  $2N + L \leq N_{\text{gen}}$

- generator has **explicit scale parameters**:  $N_{\text{gen}}$  &  $\hbar\Omega$

HO matrix elements,  $^1S_0$  channel,  $\hbar\Omega = 24$  MeV

# Choice of Generator: Block Generators

- **Q block generator**: use  $H_\alpha$  matrix elements for states below  $Q_{\text{gen}}$  and  $T_{\text{int}}$  matrix elements above, i.e.,

$$G_\alpha = T_{\text{int}} + \Pi_{Q_{\text{gen}}} V_\alpha \Pi_{Q_{\text{gen}}}$$

with projection operator  $\Pi_{Q_{\text{gen}}}$  on rel. momentum states with  $q \leq Q_{\text{gen}}$

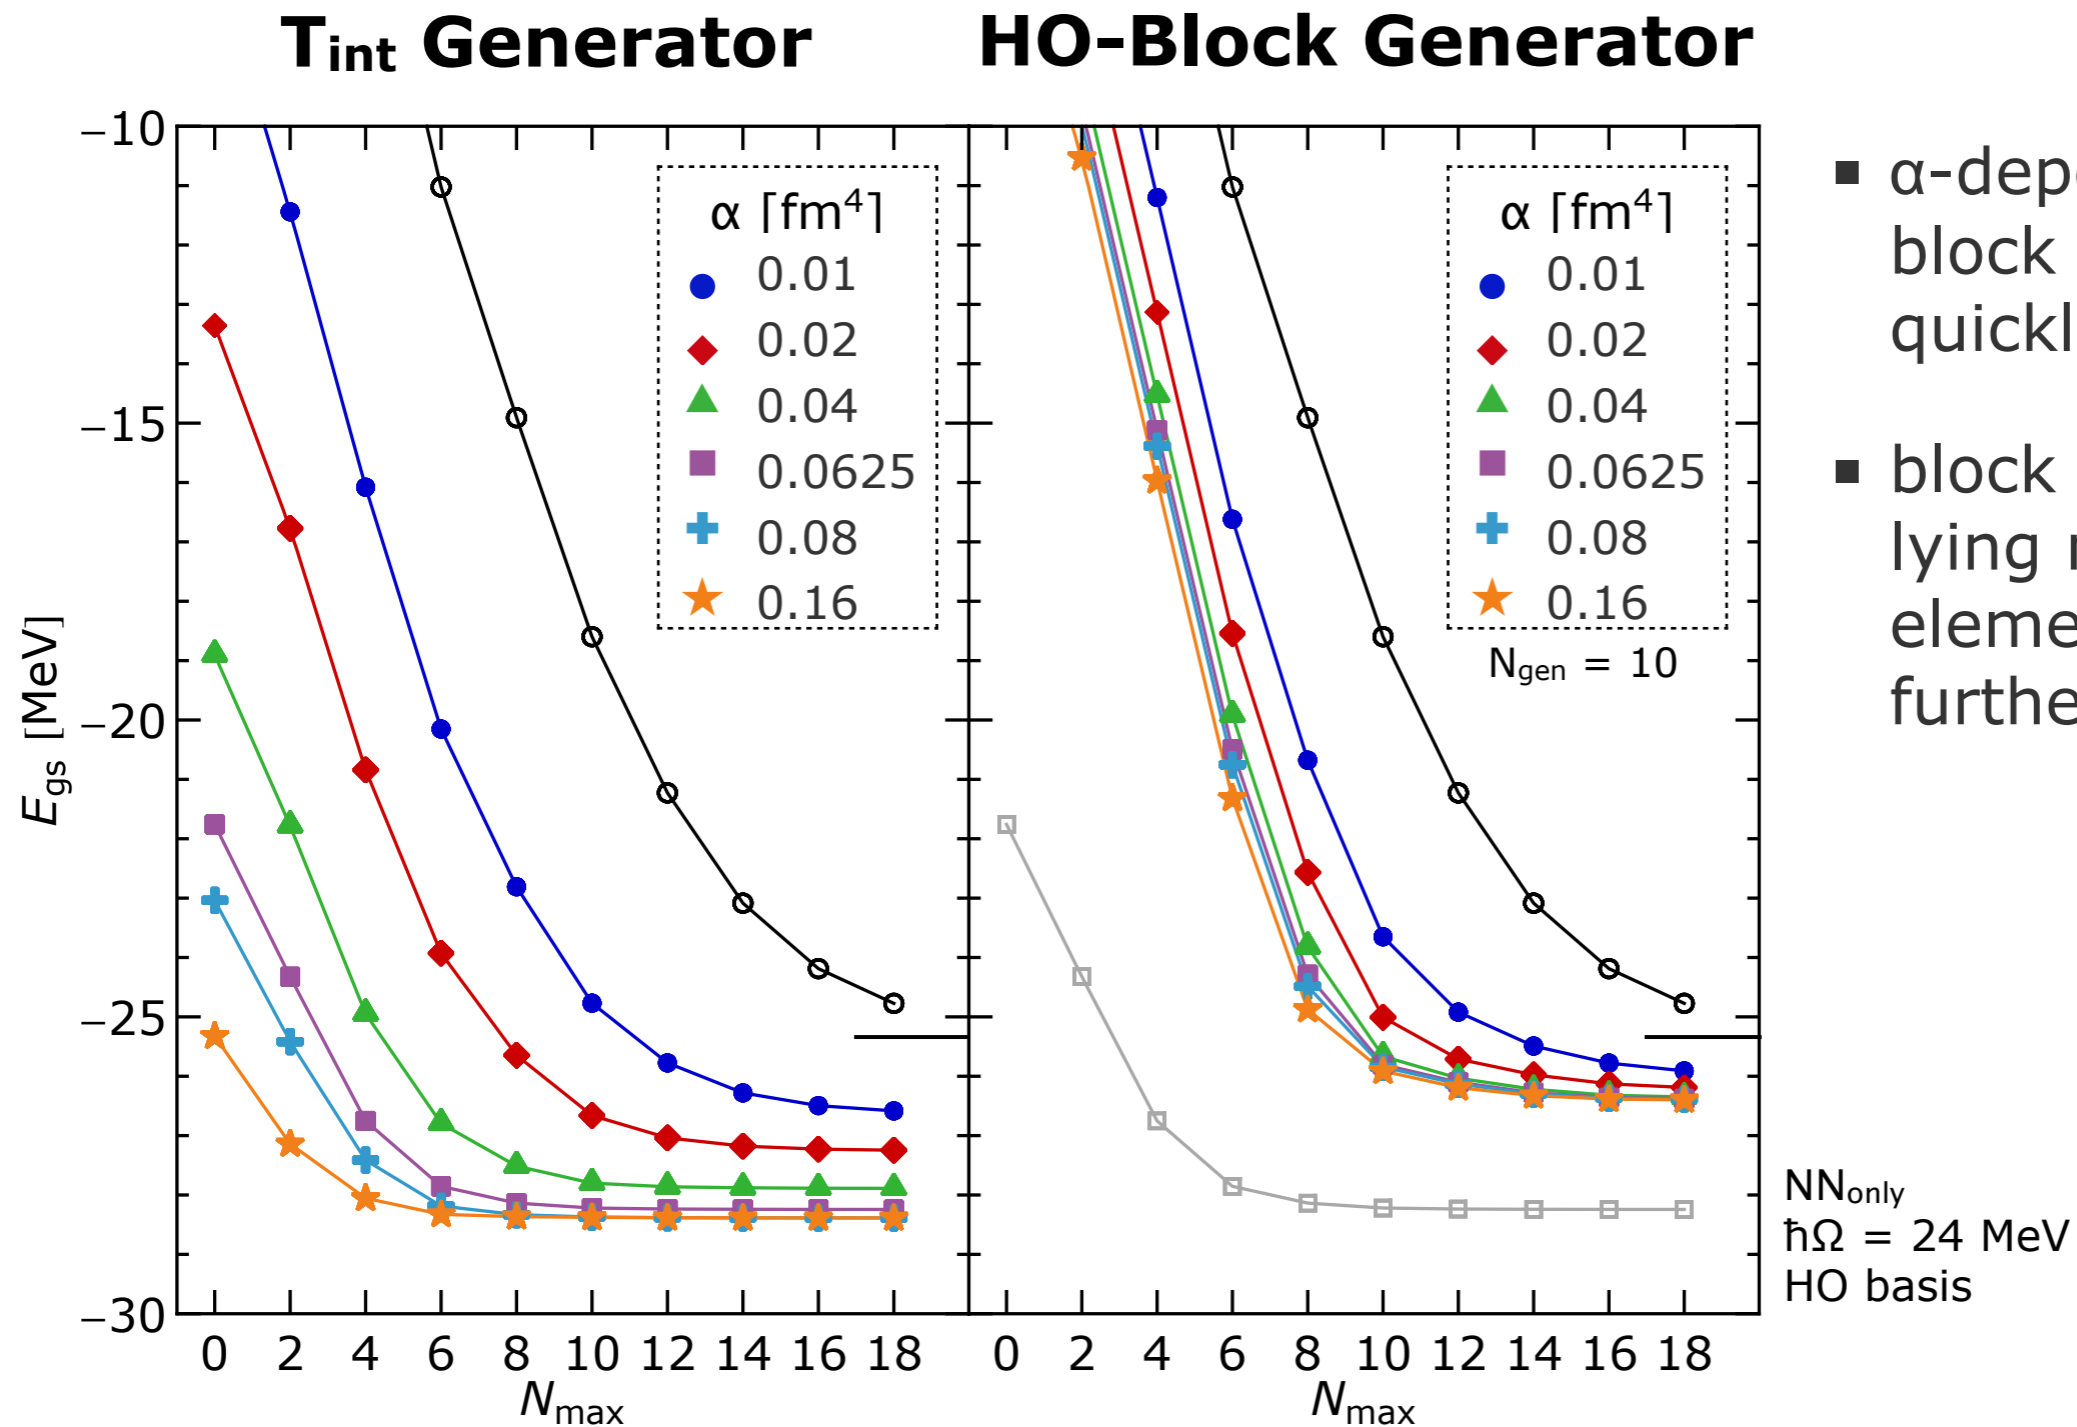

- generator has **explicit scale parameter**:  $Q_{\text{gen}}$

momentum-space matrix elements,  $^1S_0$  channel

# $^4\text{He}$ : Convergence vs. Induced Many-Body

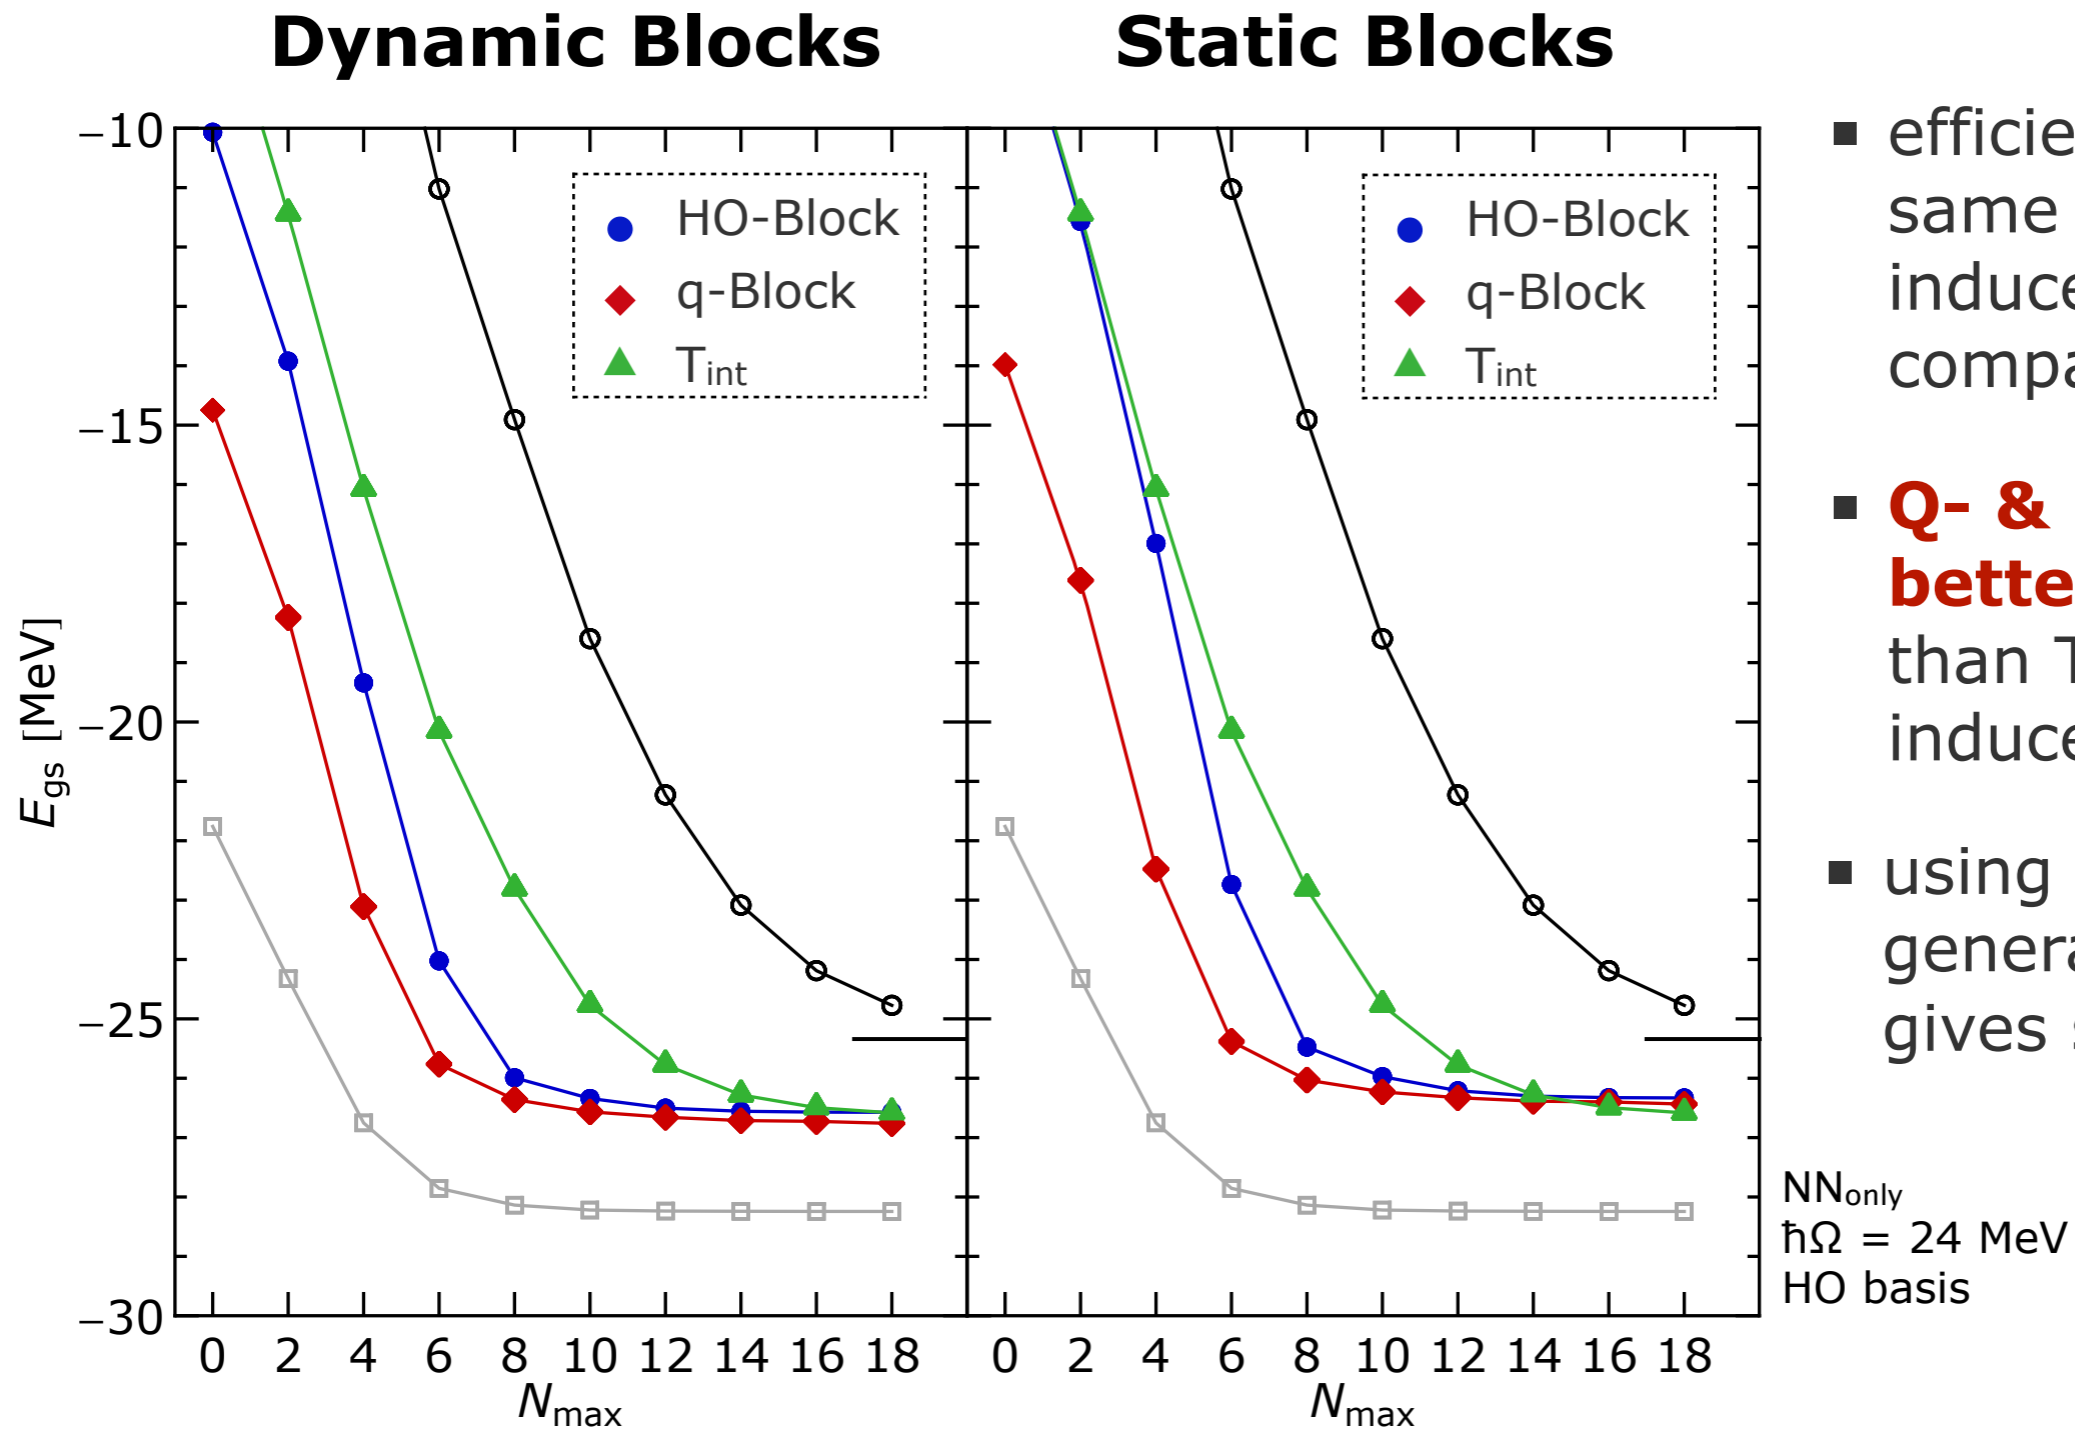

# $^4\text{He}$ : Convergence vs. Induced Many-Body

# $^4\text{He}$ : Convergence vs. Induced Many-Body

# $^4\text{He}$ : Efficiency Test

- efficiency test: dial same magnitude of induced 3N and compare convergence
- **Q- & HO-block give better convergence** than  $T_{int}$  for same induced 3N
- using static block generators ( $G_\alpha = G_0$ ) gives similar results

NN<sub>only</sub>  
 $\hbar\Omega = 24$  MeV  
 HO basis

HO-block:  $N_{gen} = 8, \alpha = 0.0625 \text{ fm}^4$       Q-block:  $Q_{gen} = 2.0 \text{ fm}^{-1}, \alpha = 0.0625 \text{ fm}^4$   
 $T_{int}: \alpha = 0.01 \text{ fm}^4$

# Towards Many-Body Applications

## SRG Evolution in 3N

- extension of block generators to SRG evolution in three-body space *rather* straight forward (with static generators)
- careful with embedding and generalisation of scale definition
- first results for HO-block generator available

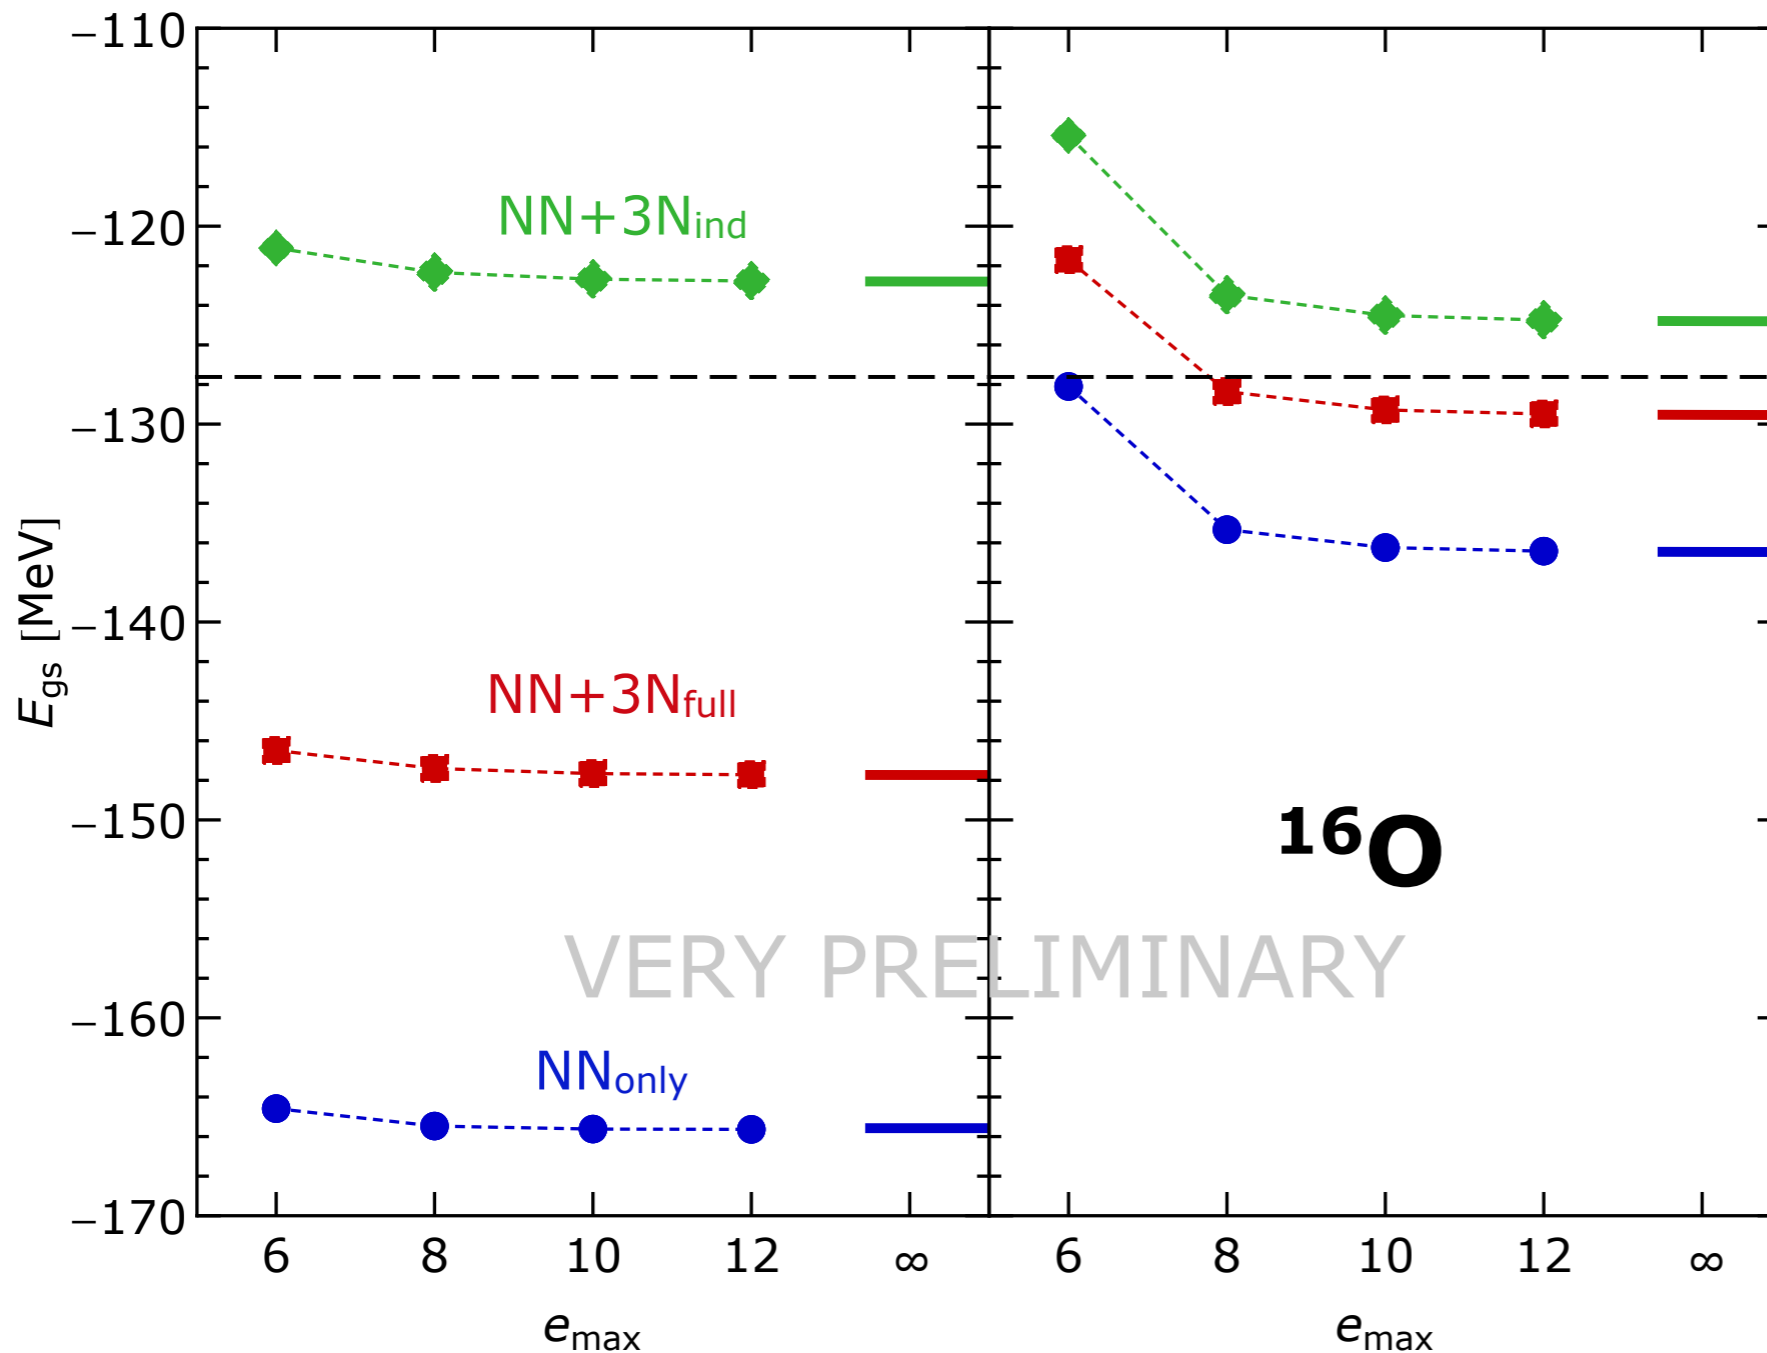

## Many-Body Solution

- any many-body approach will do, i.e., not restricted to  $N_{\max}$  truncated NCSM space
- first results from In-Medium SRG available
- using HF basis and including 3N contributions included in NO2B approximation

# IM-SRG Results

**T<sub>int</sub> Generator**

**HO-Block Generator**

- NN+3N<sub>ind</sub> agrees well for both generators: induced 4N are small as expected
- NN+3N<sub>full</sub> is much less bound with block generator

chiral NN+3N  
 $\Lambda_{3N} = 500$  MeV  
 $N_{\text{gen}} = 8$   
 $\alpha = 0.0625$  fm<sup>4</sup>  
 $\hbar\Omega = 24$  MeV  
 HF basis

# IM-SRG Results

**T<sub>int</sub> Generator**

**HO-Block Generator**

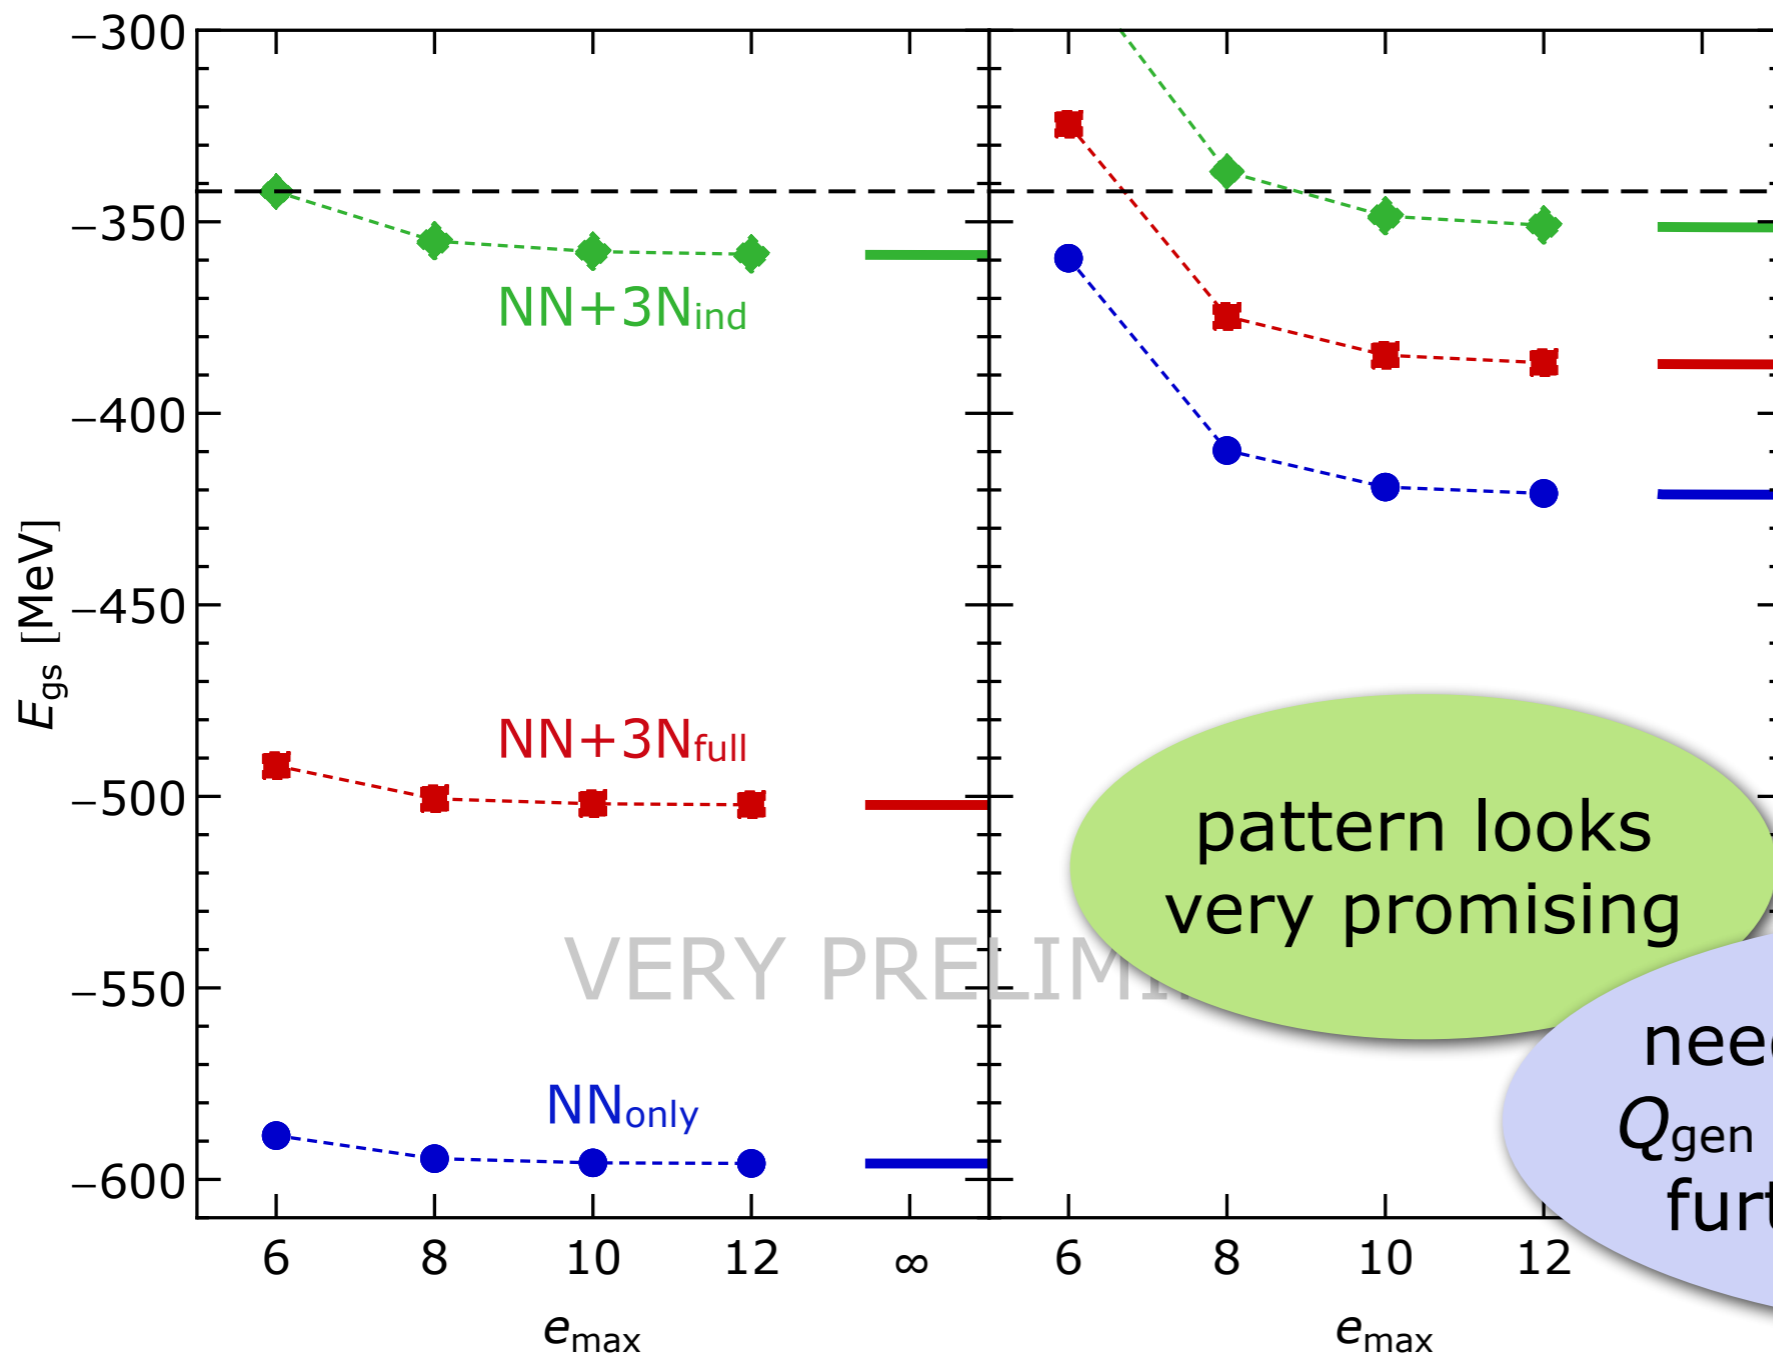

- NN+3N<sub>ind</sub> agrees well for both generators: induced 4N are small as expected
- NN+3N<sub>full</sub> is much less bound with block generator

chiral NN+3N  
 $\Lambda_{3N} = 500$  MeV  
 $N_{\text{gen}} = 8$   
 $\alpha = 0.0625$  fm<sup>4</sup>  
 $\hbar\Omega = 24$  MeV  
 HF basis

# IM-SRG Results

## $T_{\text{int}}$ Generator

## HO-Block Generator

- NN+3N<sub>ind</sub> agrees well for both generators: induced 4N are small as expected
- NN+3N<sub>full</sub> is much less bound with block generator

pattern looks very promising

need to study  $N_{\text{gen}}$  and  $Q_{\text{gen}}$  dependence and do further IT-NCSM runs

# Improved Chiral NN Interactions

with the  
LENPIC Collaboration

E. Epelbaum, H. Krebs, U.-G. Meißner, S. Binder, K. Hebeler, J. Langhammer,  
J. Golak, R. Skibiński, K. Topolnicki, H. Witała, P. Maris, H. Potter, J. Vary, A. Nogga,  
H. Kamada, D. Furnstahl, V. Bernard, A. Calci

# Improved Chiral NN Interactions

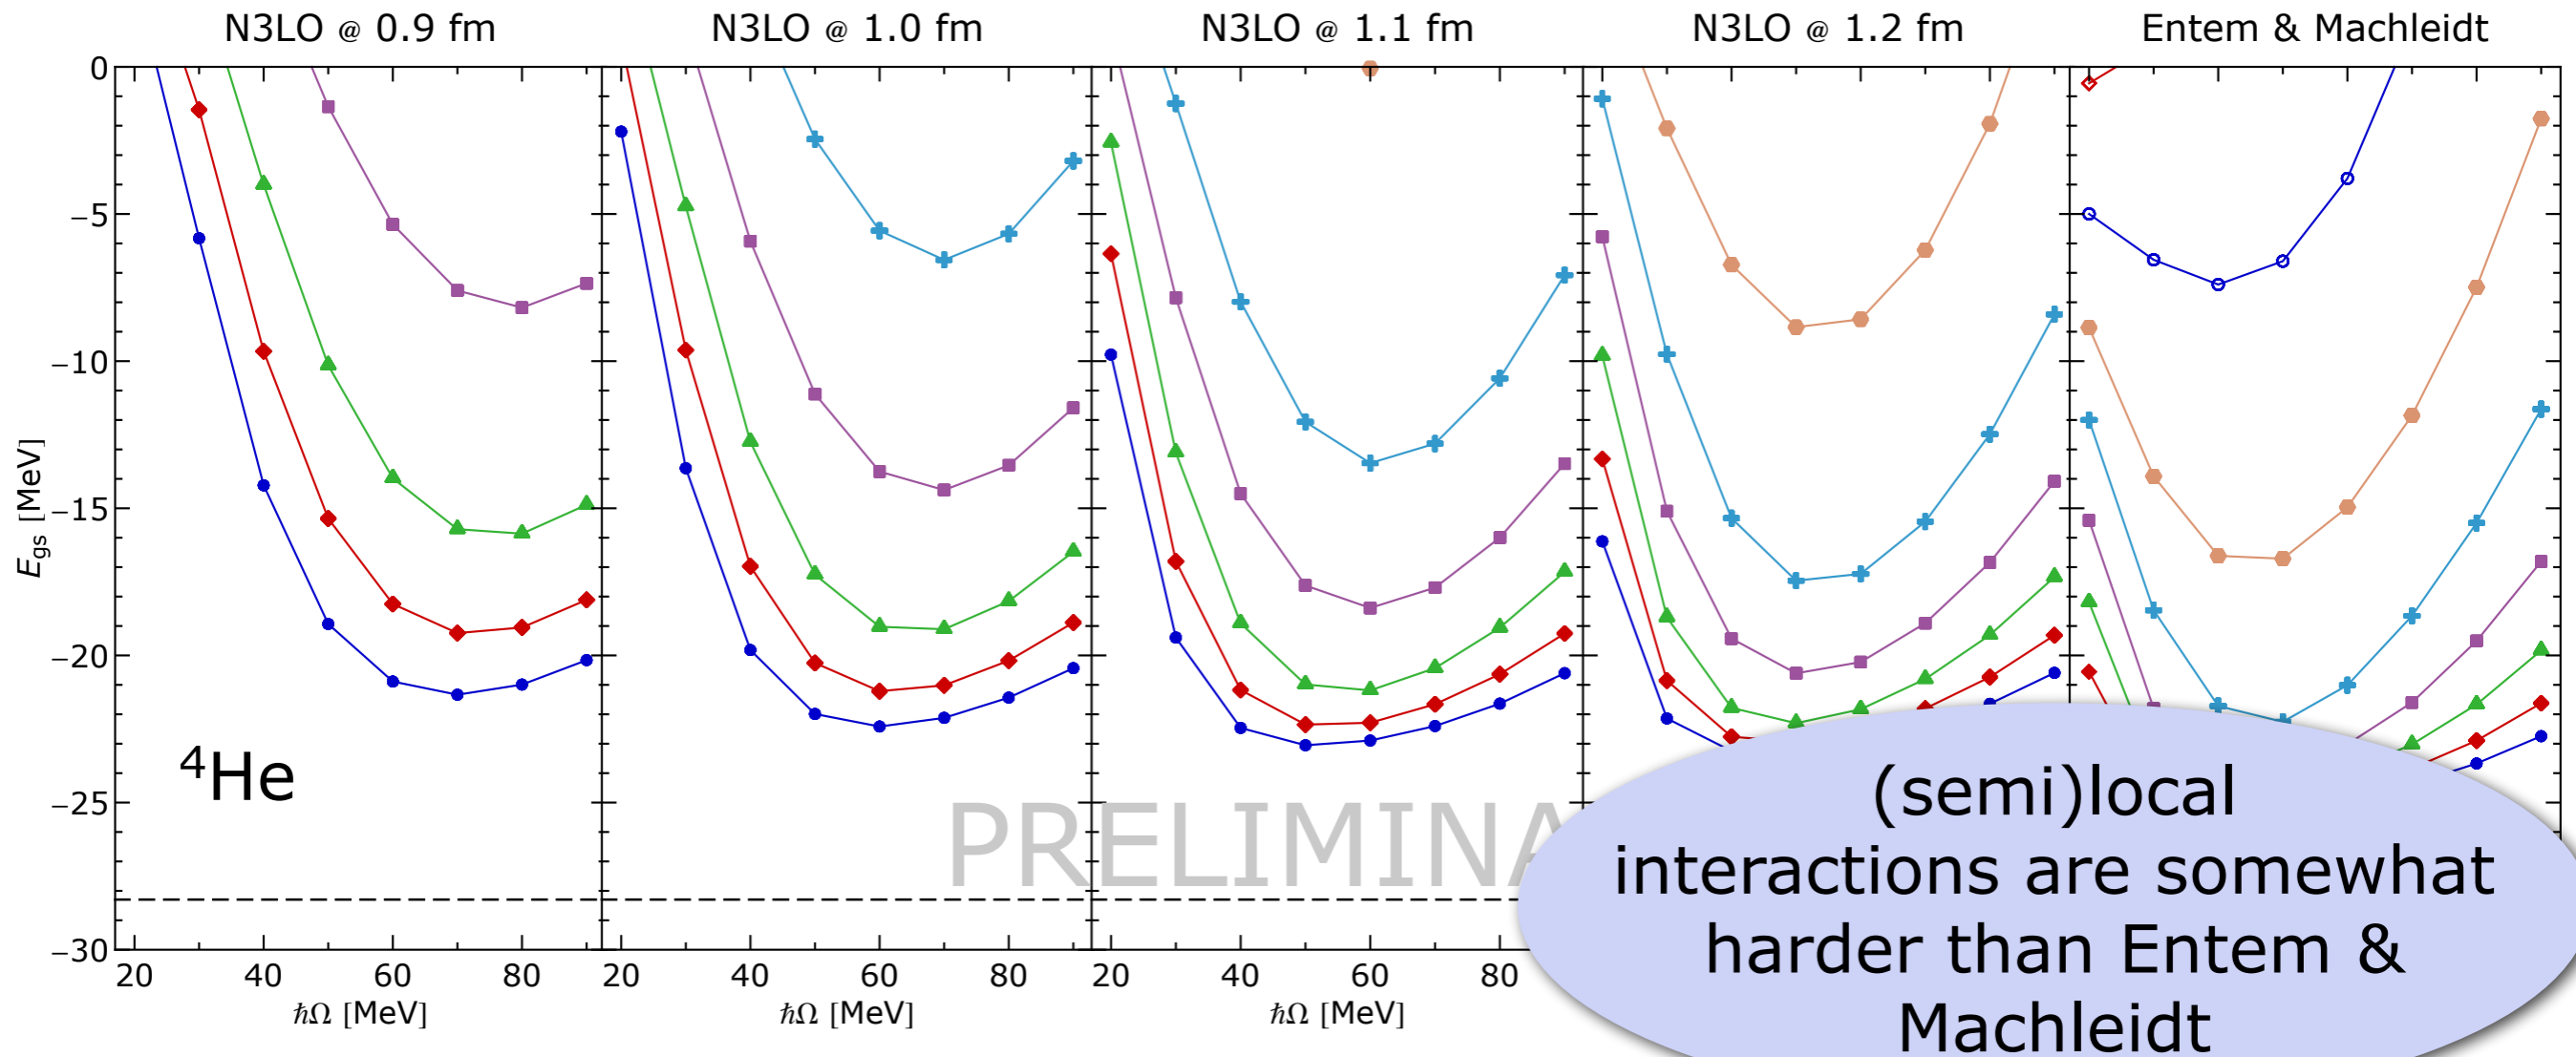

- family of improved chiral NN interactions from LO to N4LO with (semi)local regulators [talk by Hermann Krebs]

Epelbaum, Krebs, Meißner, arXiv:1412.0142 & 1412.4623

- matrix elements of corresponding 3N interactions up to N3LO are being generated [talk by Kai Hebeler]
- initial **questions from many-body perspective:**
  - how do (semi)local regulators affect convergence?
  - what is the order-by-order systematics of observables and convergence?
  - uncertainty estimation from order-by-order at fixed cutoff feasible?
  - do the interactions behave well under SRG transformation?

# $^4\text{He}$ : Cutoff Dependence @ N3LO

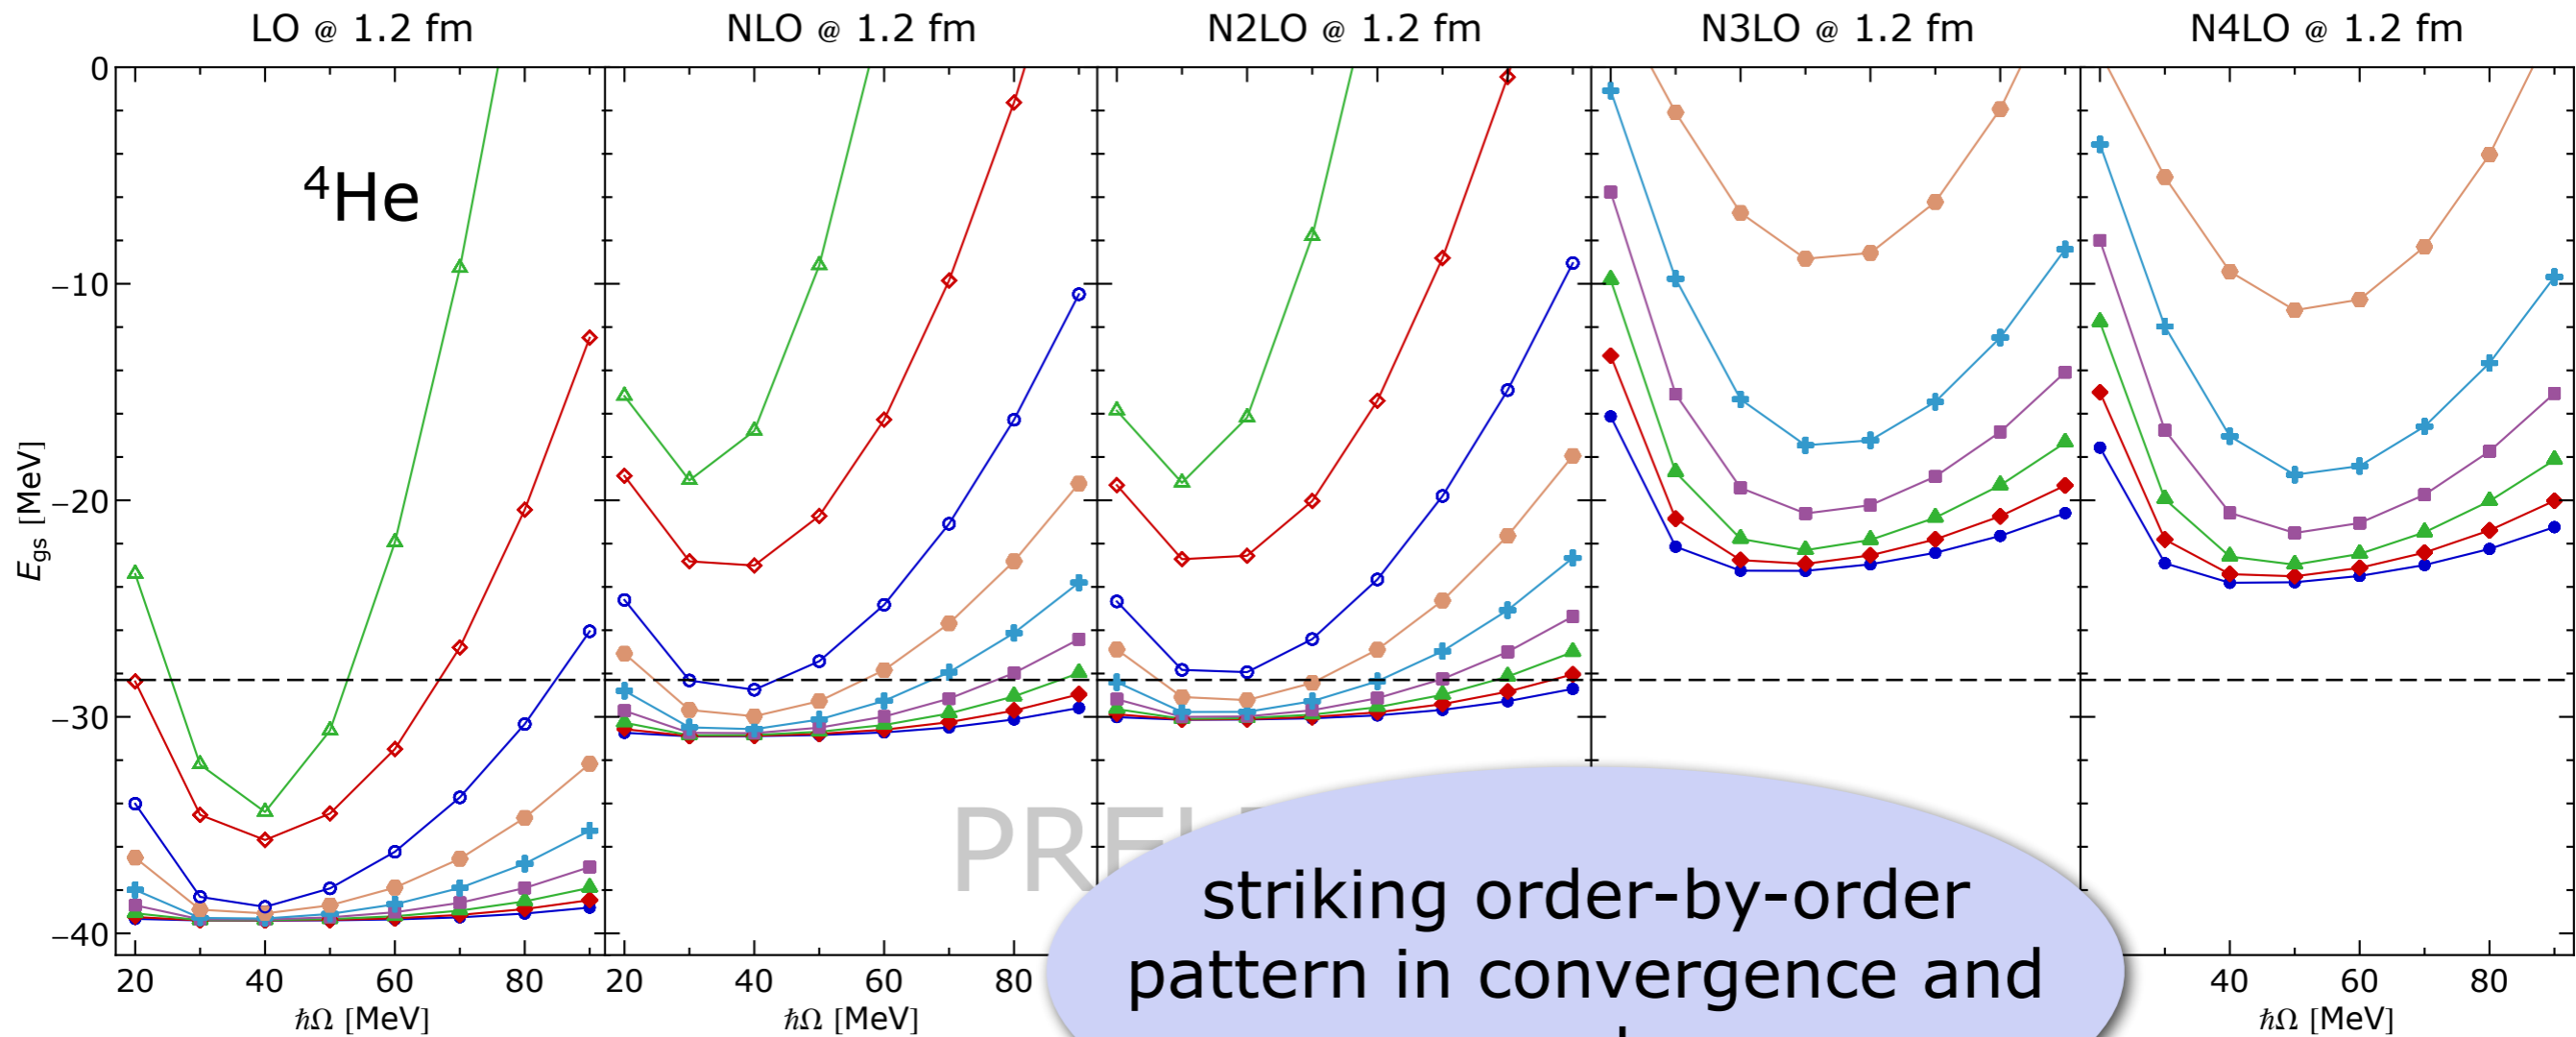

LENPIC Collaboration, in prep.

N3LO,  $R = 0.9 \dots 1.2$  fm  
bare NN

# $^4\text{He}$ : Order-by-Order @ 1.2 fm

LENPIC Collaboration, in prep.

correlated with appearance of new contacts/LECs

# Epilogue
